Brand Guidelines

v1.0 – 2026-06-02

Introduction

“The brand is not defined by what it says it is, but by what it consistently does.”

This is a system guide for how the brand builds its character over time.

It is not about doing the same things over and over. It is about acting in a way that builds a clear sense of intent, attitude, and personality that others can recognize.

You don’t order the same dish every time you go out. But over time, your friends still learn your preferences. Not because you repeat yourself, but because your choices come from the same underlying principles. People start to understand who you are from how you behave, not from what you claim to be.

It’s the same here. The brand is not defined by what it says it is, but by what it consistently does. That behavior is what builds the image and character that others assign to it.

The goal is not to limit choices. It is to make sure the intent behind those choices stays consistent, so the work always feels like it comes from the same place.

Core Idea

To understand the brand's archetype and look and feel, it helps to understand the origins of the system.

The music industry used to be driven by artists and the people who listened to them. Over time, a small group of people in power began controlling who gets seen, what gets heard, and what gets pushed forward.

For most artists, success depends on getting permission from those in power. For most fans, the role is limited to consuming what has already been selected.

We think that's the wrong shape for culture.

Music still moves through the same system as everything else. Attention and capital decide what moves and what doesn't.

The problem is not a lack of capital. The real issue is that there is no way for artists and fans to organize in a direct, coordinated way that can compete with the major players in the industry.

We are building that system.

A system that gives people the tools to organize around artists they believe in, and to coordinate support without middlemen deciding what gets through.

Music moves within the system that already exists. We are just changing who gets to move it.

What it Feels Like

Emotional tone

- High-energy, not chaotic
- Direct, not performative
- Confident, not loud
- Grounded, not polished

Behavioral tone

- Doesn’t over-explain
- Says things plainly
- Doesn’t try to persuade
- Points at something real, not trying to sell something

Visual instinct

- Controlled energy, not flashy
- Restraint with moments of intensity
- Documentary realism, not advertising polish
- Tension over decoration

Social tone

- Not polite corporate voice
- Not hype-driven startup voice
- Not inspirational brand voice
- Statement of reality, not persuasion

Voice Principles

Speak directly

- Say what is meant with fewer words
- Don’t over-explain
- Don’t soften the message
- Clarity over elegance

Assume intelligence

- Don’t simplify ideas unnecessarily
- Don’t talk down
- Don’t over-contextualize

Don’t perform

- No hype language
- No forced inspiration
- No exaggerated enthusiasm

Say it simply

- Use simpler words
- Avoid corporate jargon
- Avoid academic-sounding language
- If there is a simpler word, use it

Show conviction

- State a position clearly
- No convincing needed
- Clarity is enough

Intended Perception

Easy to understand

- Meaning is always clear
- No decoding necessary
- What is said is what is meant

Action first

- No unnecessary narration of intent
- Energy shown through doing, not signaling
- Outcome driven

Clear intent

- No bullshit, not filtered
- Feels like it’s from the source, not a presentation
- Meaning comes through

Casual confidence

- In control without needing to show it
- No indecisiveness
- Presence comes from certainty, not performance

Restrained

- Space and silence is by design
- Feels high energy but it’s controlled
- Feels complete without feeling overstuffed

Fixed Elements

You recognize people from their face, their voice, the way they walk, the way they put sentences together. Their name is part of their identity but that alone doesn’t give you a full picture of who they are.

Same here. The typemark, icon, typeface, color system, and graphic elements all work together as one consistent package. They are not separate parts, they build the same identity from different angles.

The logo is one part of the identity, but it’s not the goal. The real goal is to build enough consistency across everything that the brand becomes recognizable even without the logo.

These elements stay fixed so the recognition is built through consistency. If you changed your name, your voice, your face just for variety, how would your friends recognize you?

Identity System

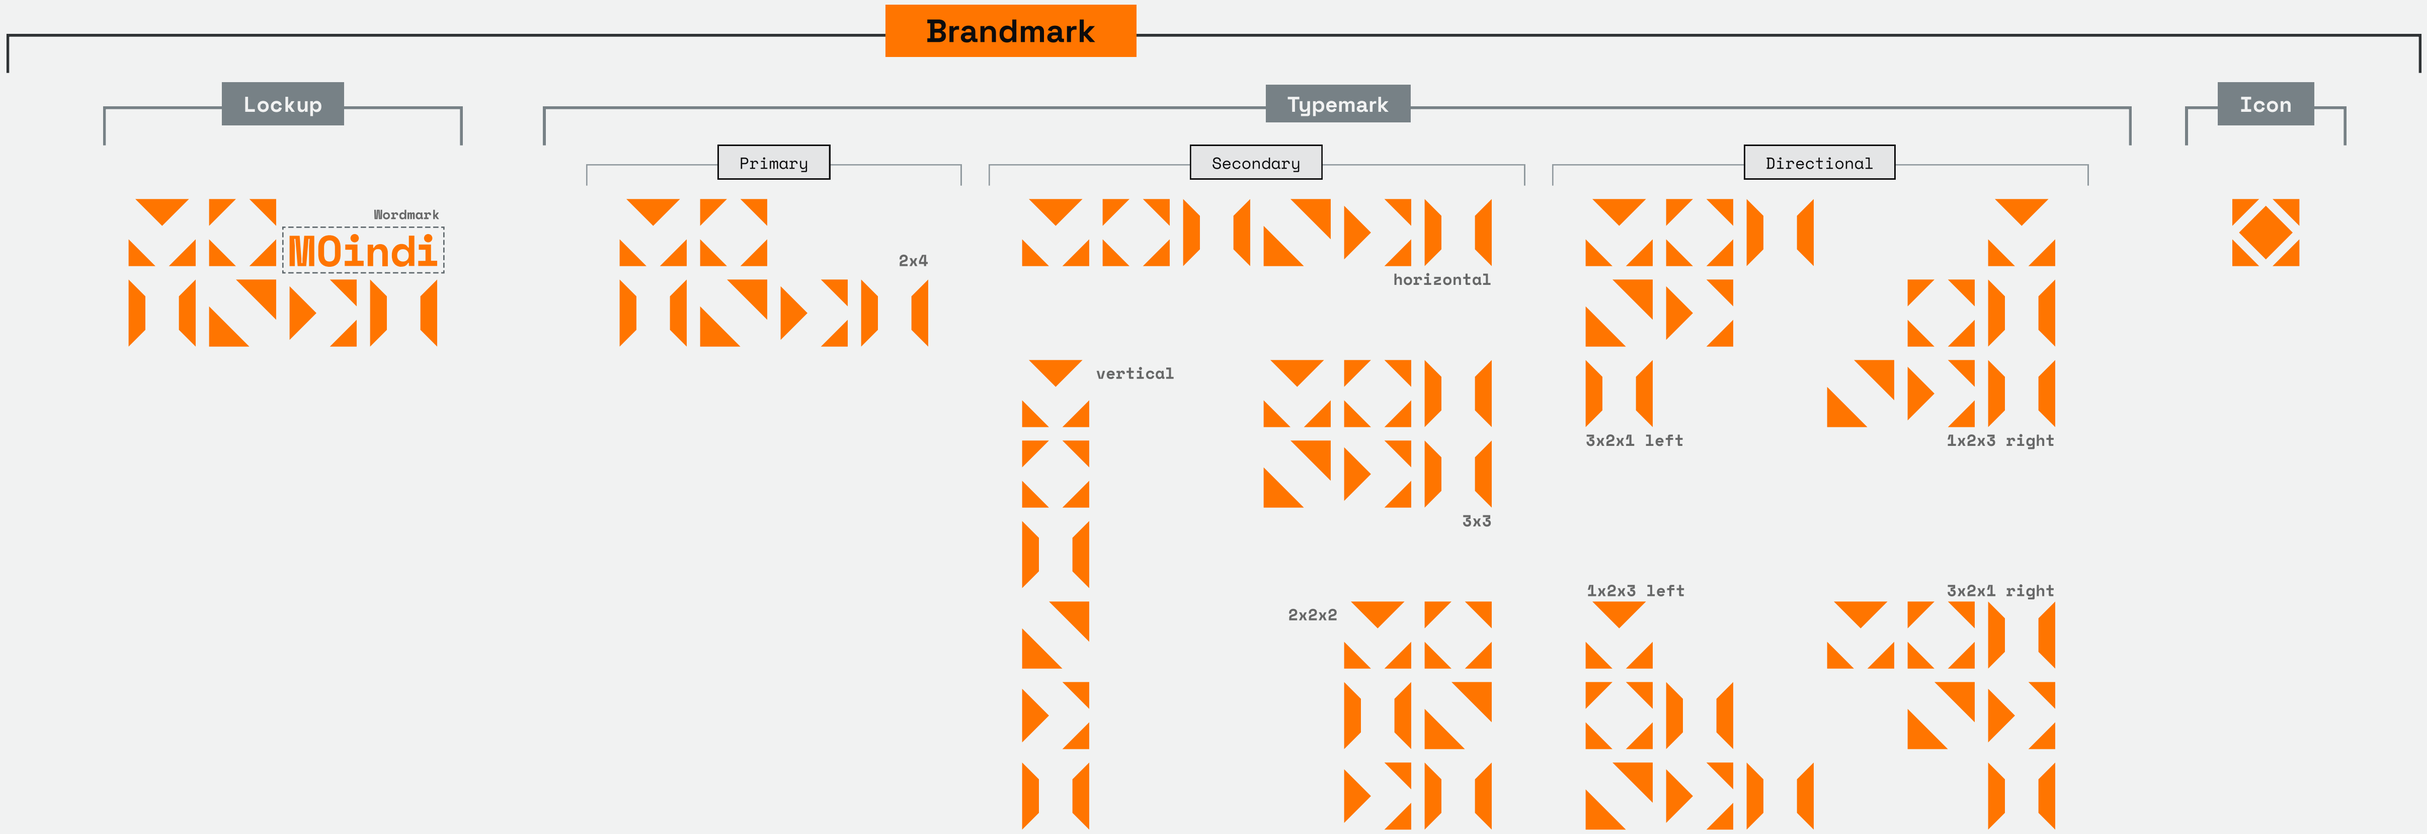
Instead of a traditional logo, the brand's identity was made to adapt to different constraints while feeling like they are related (because they are).

The typemark and the icon were made by rearranging sections from a modular source shape. Since each letter comes from the same source, they can be rearranged in multiple ways. To maintain recognition, only a set of variants are available. Variants are selected based on context, not preference.

The typemark is **not** designed for immediate legibility. It's an **identifier** that you can discover they're letters. And once you see it, you can't unsee it.

Terminology

Because the term “logo” is too broad, we will be using specific terms to refer to each variation



Cheatsheet

Does the directional variation improve the composition?
YES
Use Directional

Stylization

The stylization is part of the brand identity and should be treated the same way as the logo or color palette.

The capitalization is intentional:

- **M** and **O** are uppercase
- **i**, **n**, **d**, and **i** are lower case

Exceptions can only be made when there's a technical reason where mixing uppercase and lowercase can cause problems (like urls, file names, email addresses, or other system text).

Social handles, where capitalization rules are inconsistent, the preferred handle is **@mo__indi**. The double underscore acts as a visual break normally created by the uppercase. The goal is to remove ambiguity in pronunciation.

We can't always control the typefaces used in different contexts (for example, publications follow their own typographic guidelines), but the stylization keeps the brand consistent even when typefaces change.

Lockup

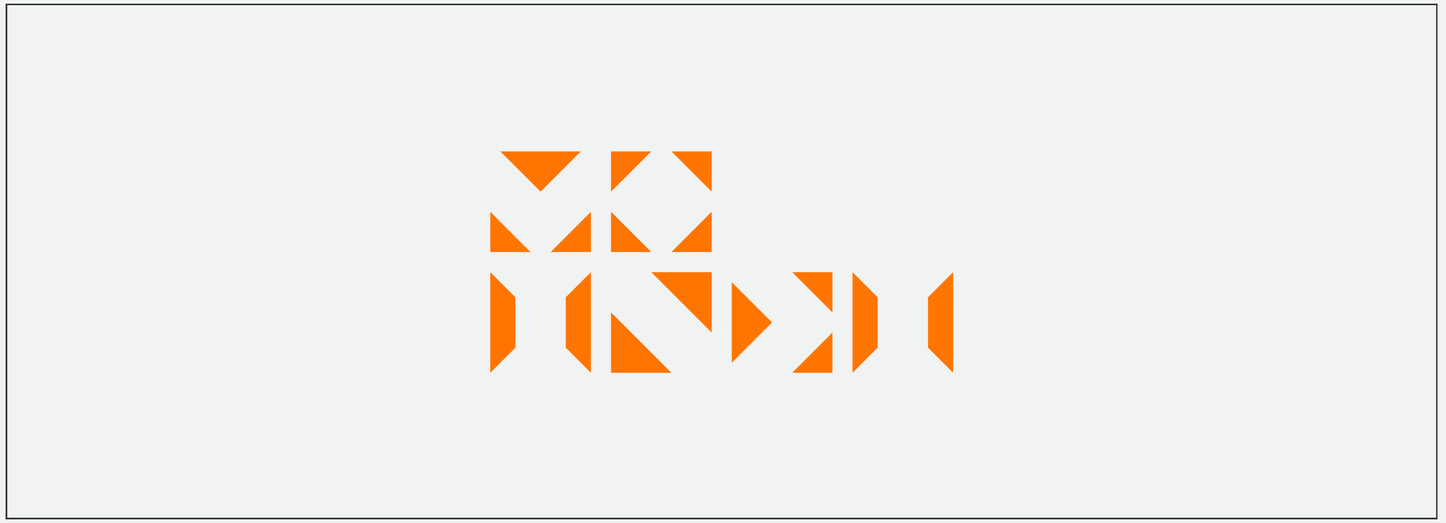
This is the default.

A lockup with a fully legible wordmark should be used when the viewer may not already know the brand.

When the viewer already has context, typemark should be used instead.

Primary

2x4



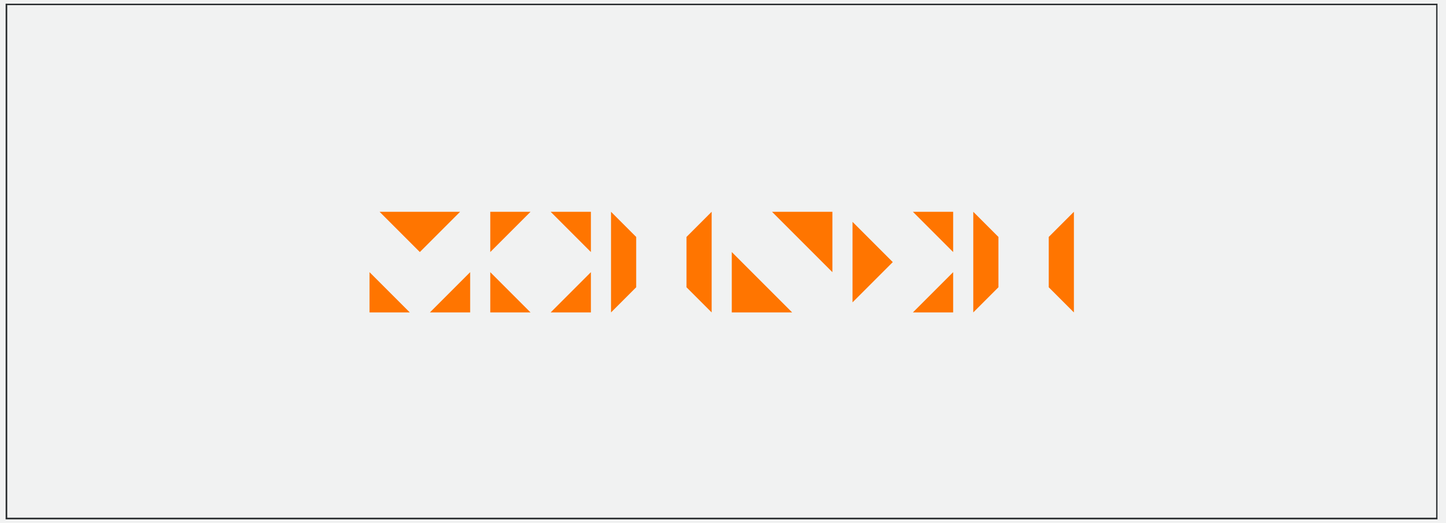
This is the default typemark arrangement.

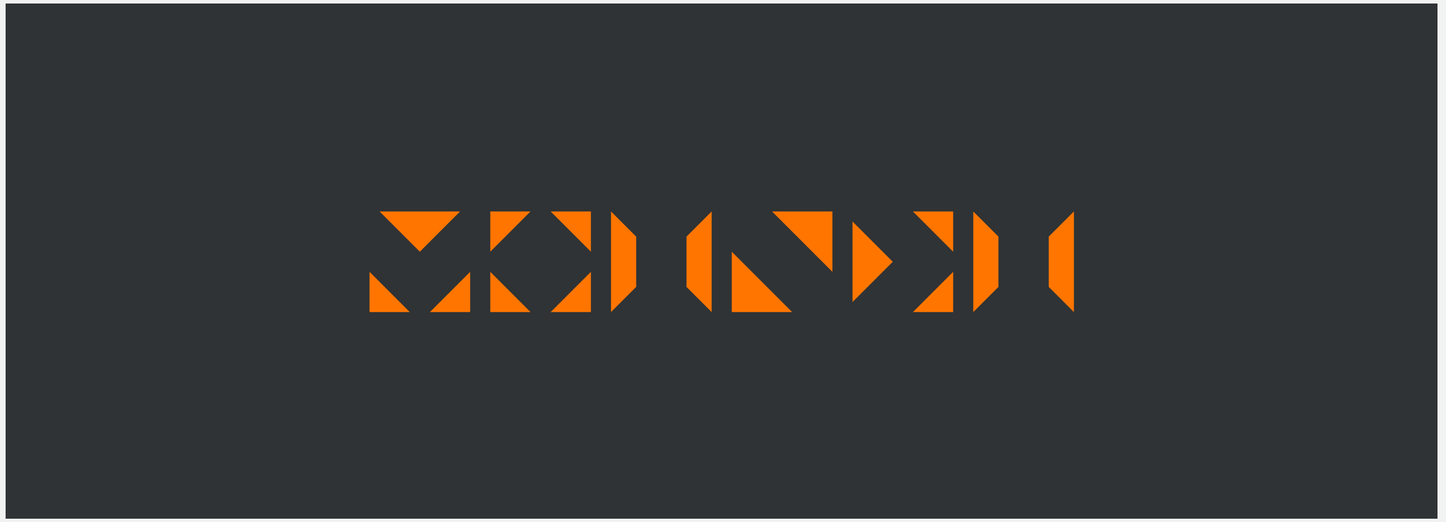
It should be used whenever there are no strong constraints from the format..

Use this in general placements where space allows and no specific orientation is imposed, such as posters, web headers, or standard layouts.

Secondary

Horizontal





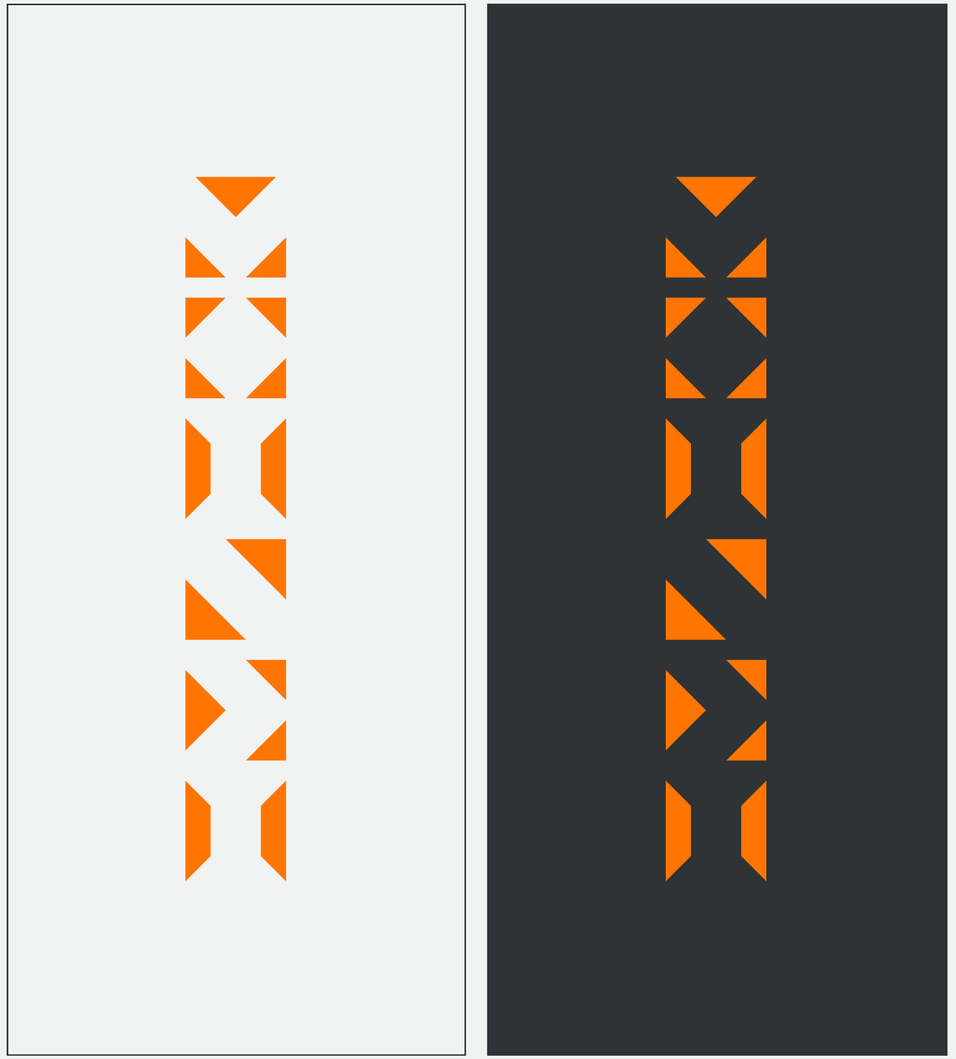
Use when the space is wide but flat.

Use in formats where the typemark needs to sit within a narrow horizontal band.

Examples: pens, horizontal banners, navigation bars, lower thirds.

Secondary

Vertical



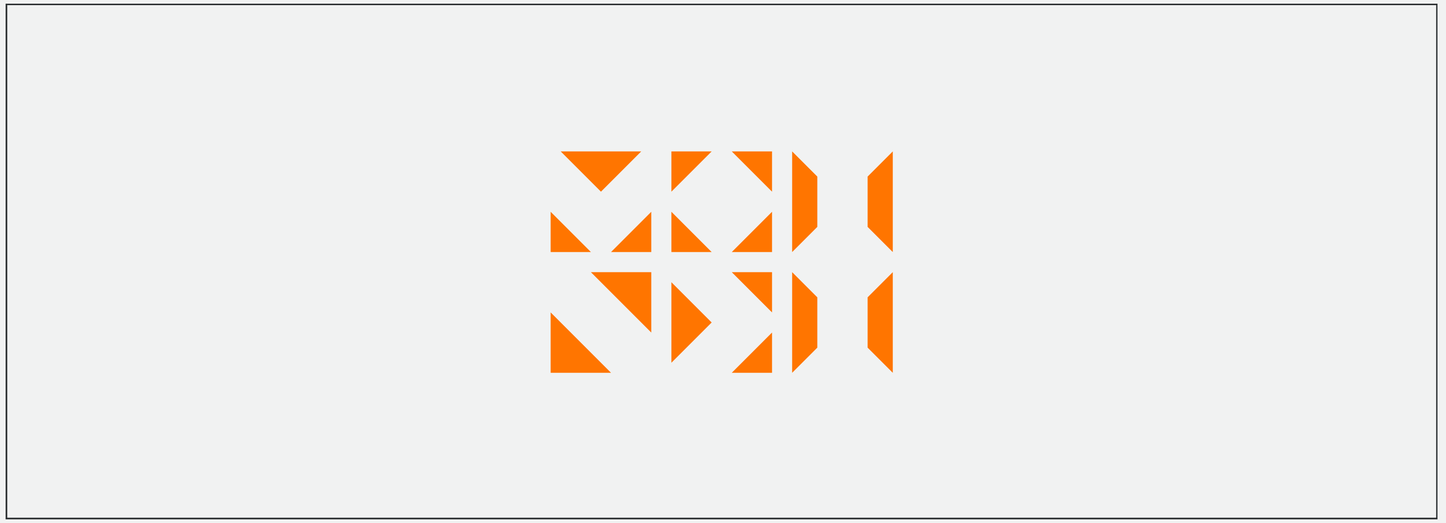
Use when the space is tall and narrow.

Use it places where the mark needs to fit within a narrow vertical area.

Examples: bottles, tall signage, vertical banners, narrow side placements.

Secondary

3x3

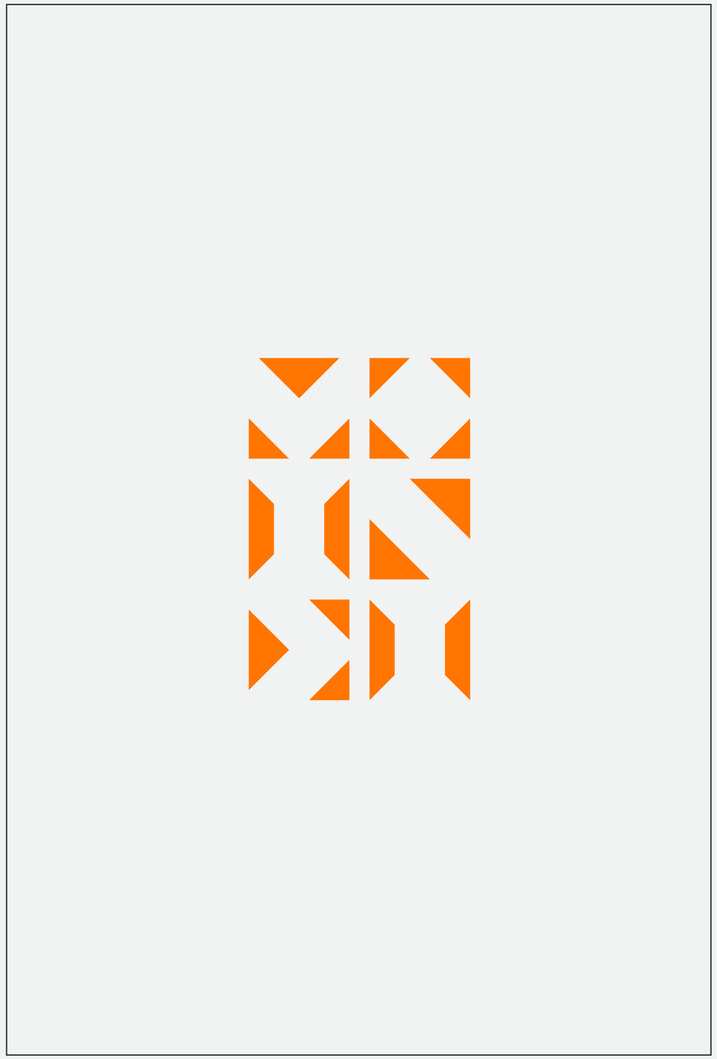


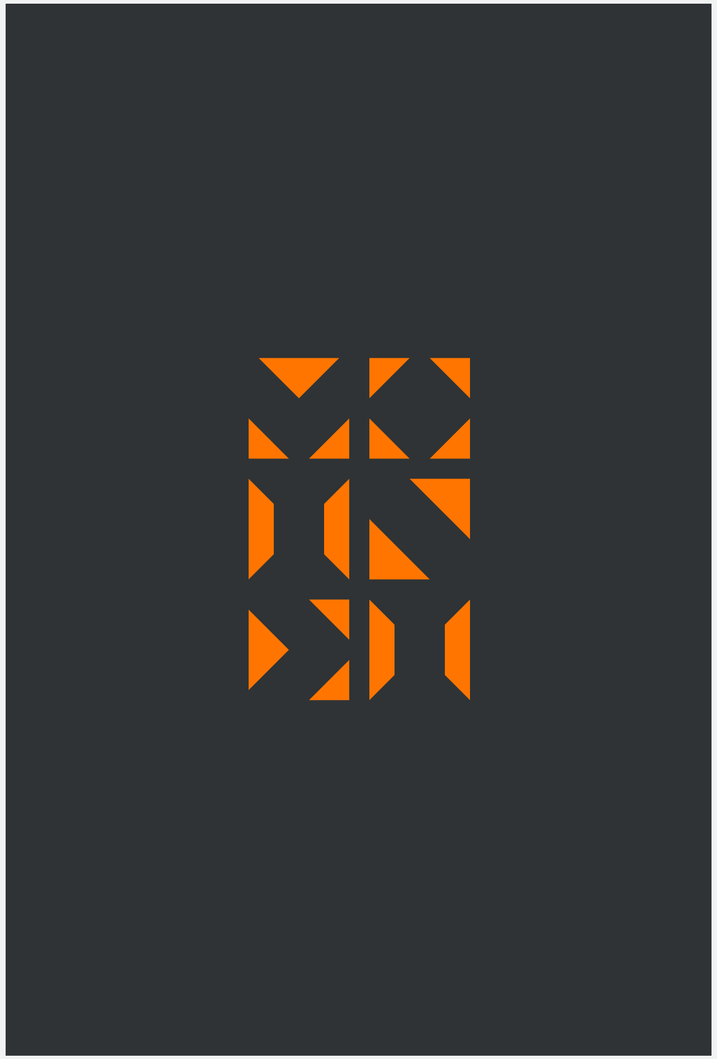
Use when space is limited and wider than it is tall, but not wide enough for the 2×4.

Examples: tight horizontal layouts, overlays, small placements in landscape formats.

Secondary

2x2x2



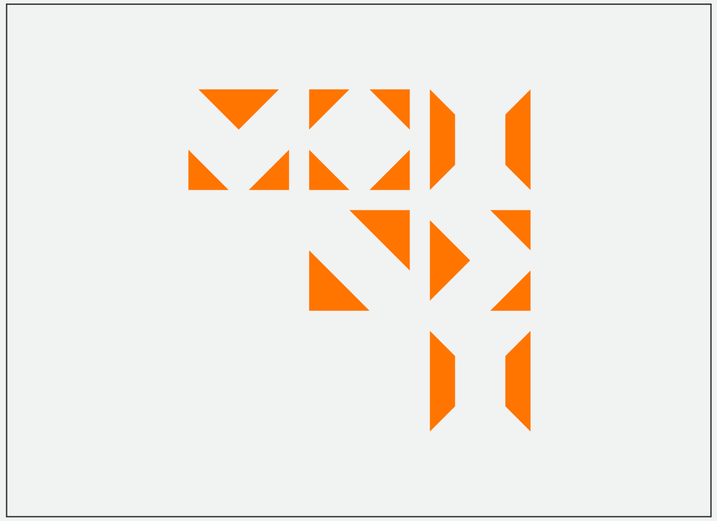


Use when space is limited and taller than it is wide, but not narrow enough for the vertical version.

Examples: constrained vertical layouts, side placements, street banners, editorial columns.

Directional

3x2x1 (upward)



This arrangement forms an upward arrow, pointing left or right. Use only when direction reinforces the meaning or composition.

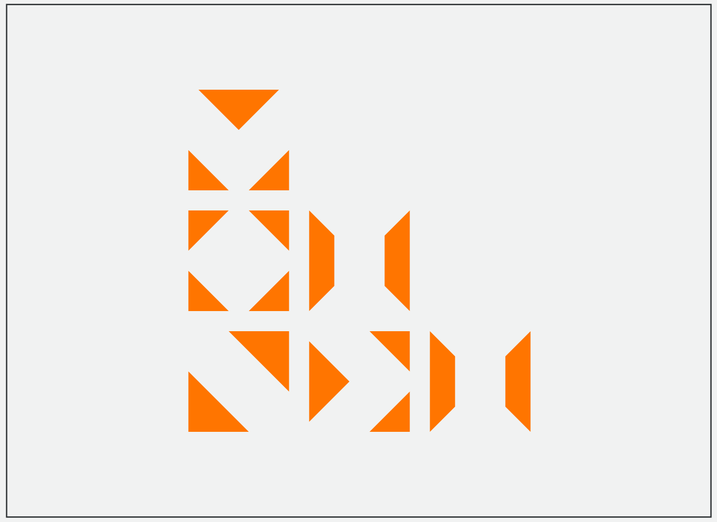
Use in settings where movement, progression, or forward momentum is part of the message.

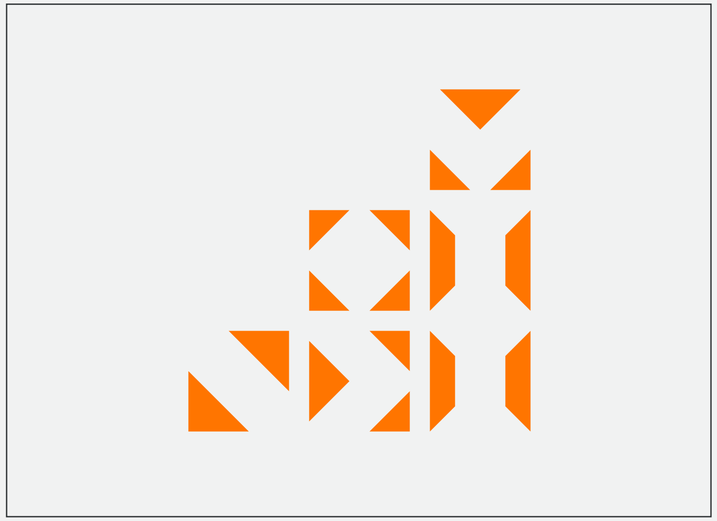
Example: print ad where the brandmark can direct attention toward key content.

Not for neutral placements.

Directional

1x2x3 (downward)



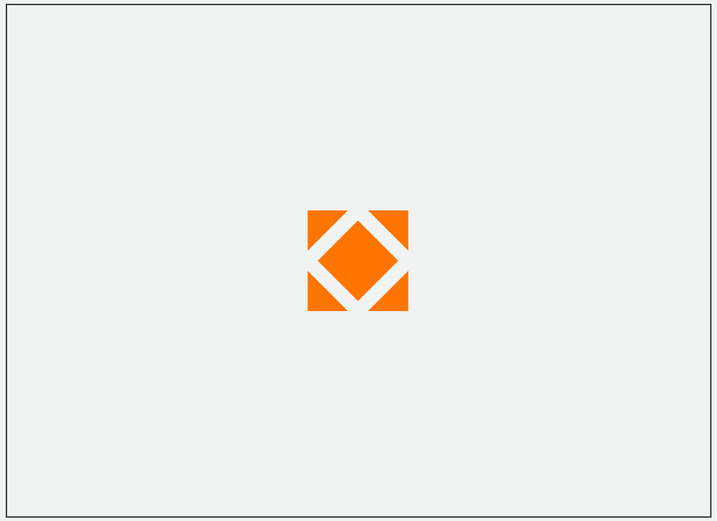


This is the counterpart that points down. Same rule applies, use it only when the direction reinforces the meaning or composition.

Example: when anchoring content or balancing an otherwise top-heavy layout.

Not for neutral placements.

Icon



The icon is not a logo. It is a fallback identifier used only when the typemark is not practical.

It represents the same system as the typemark but in its most reduced form. **It should never replace the typemark when space allows.**

Use only when the format requires a compact, non-text-based identifier.

Examples:

- app icon
- favicon
- social media profile image
- very small UI placements where text becomes illegible

The icon exists only for recognition at extreme scale constraints.

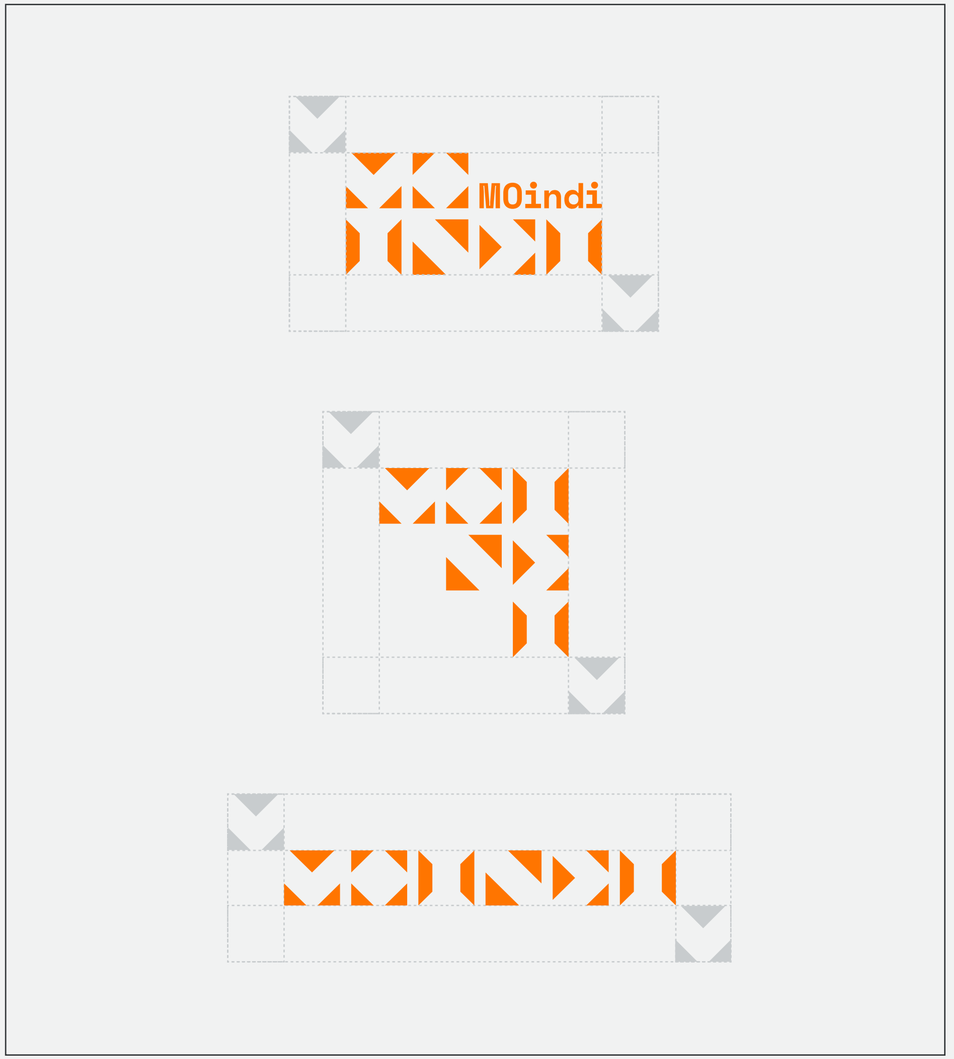
Placement

How the identity marks are placed is an important requirement. the purpose is always clarity. Placing it in front of a busy pattern or using the wrong variant or not having enough clearspace can make the brand look sloppy and unprofessional.

These rules should be the default and an exception should be considered when following the rule makes the composition or usability worse. For example, the wordmark in the navbar has a smaller clearspace than the rule, but following it would have made either the navbar too tall or the wordmark too small. But even when exceptions are made, it still has enough breathing room that doesn’t feel cramped.

Clearspace

Lockup & Typemarks



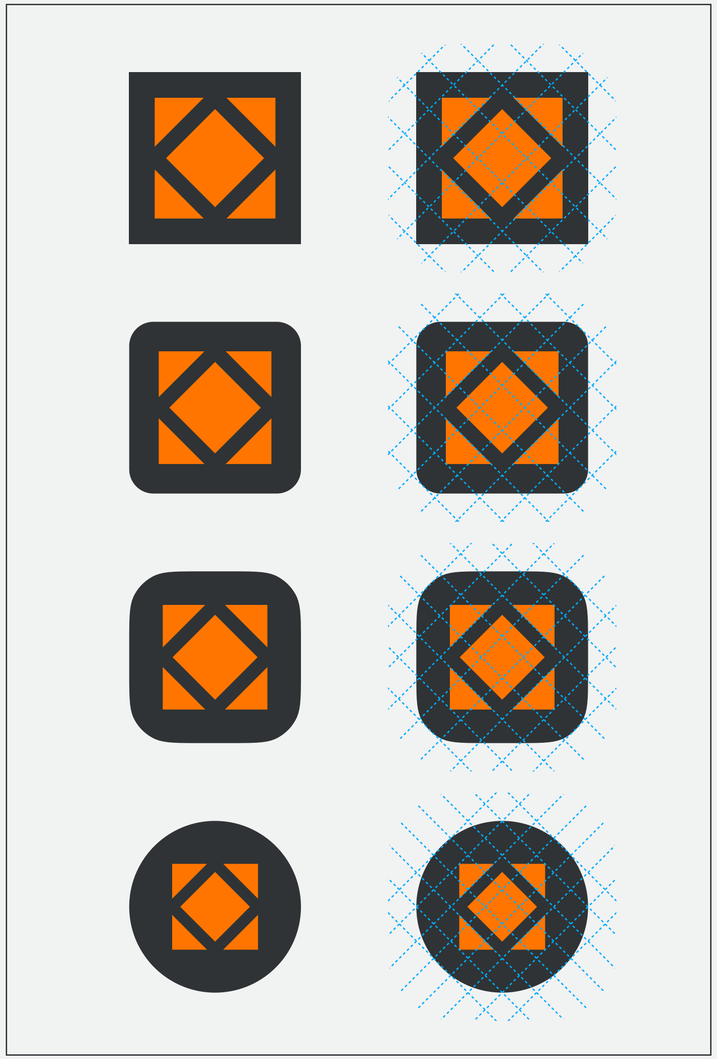
Clearspace is the breathing room around the typemarks. All variants have the same clearspace: a **minimum** of one character's height and width on all 4 sides.

Clearspace doesn't always require a solid background. It's a safe zone where no other elements are competing or disrupting the typemark. This prevents the typemarks from getting lost in the design.

Think of it like a signature for a painting. It doesn't dominate the work, but it's placed in a quiet surface so it's discoverable and recognizable.

Clearspace

Icon



The icon's clearspace is one-fifth (1/5) of the icon's diagonal measurement.

The icon size is based on the maximum distance from the center to the rendered boundary of the shape, including corner radius.

This means the same square can give you different sizes depending on its corner radius. With no rounded corners, where s=side, the diagonal is $\sqrt{(s^2+s^2)}$. As the corner radius (r) increases, the outermost boundary moves inward, reducing the diagonal by $r(\sqrt{2}-1)$ on each corner, which makes the diagonal = $\sqrt{((s^2+s^2) - 2r(\sqrt{2} - 1))}$, which simplifies to $D = s\sqrt{2}-2r(\sqrt{2}-1)$.

Because all measurements are taken from the furthest point of a 1:1 frame, the spacing is consistent from square to squircle to circle.

... but not everything needs to be perfectly measured. Just make sure there's enough breathing room.

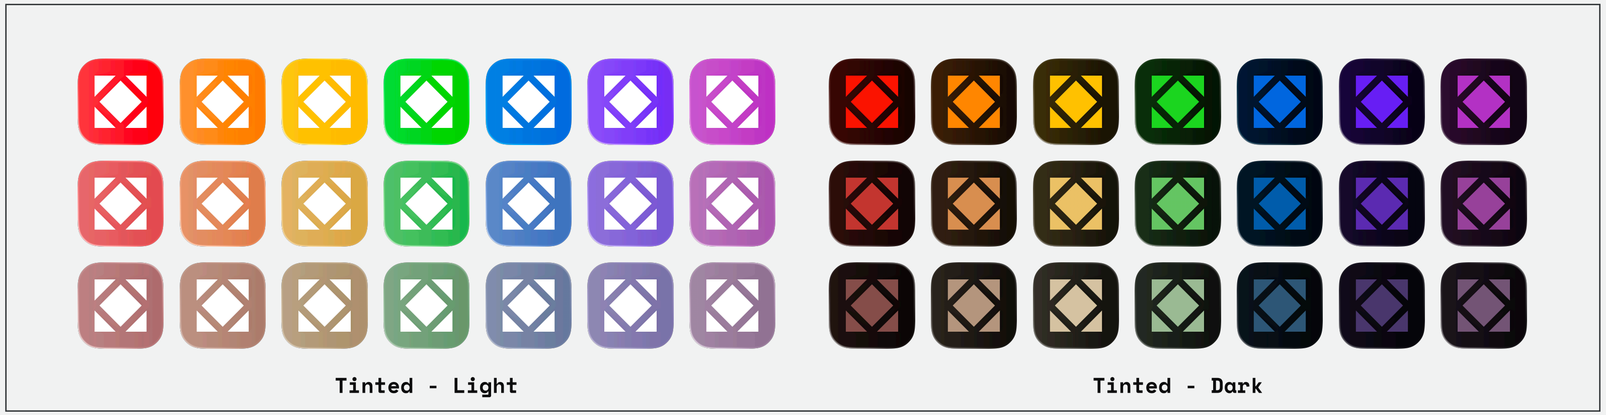
App Icon

Apple

Apple has their system that defines the shape, behavior, lighting rules of their platform and users can customize the icon's appearance.

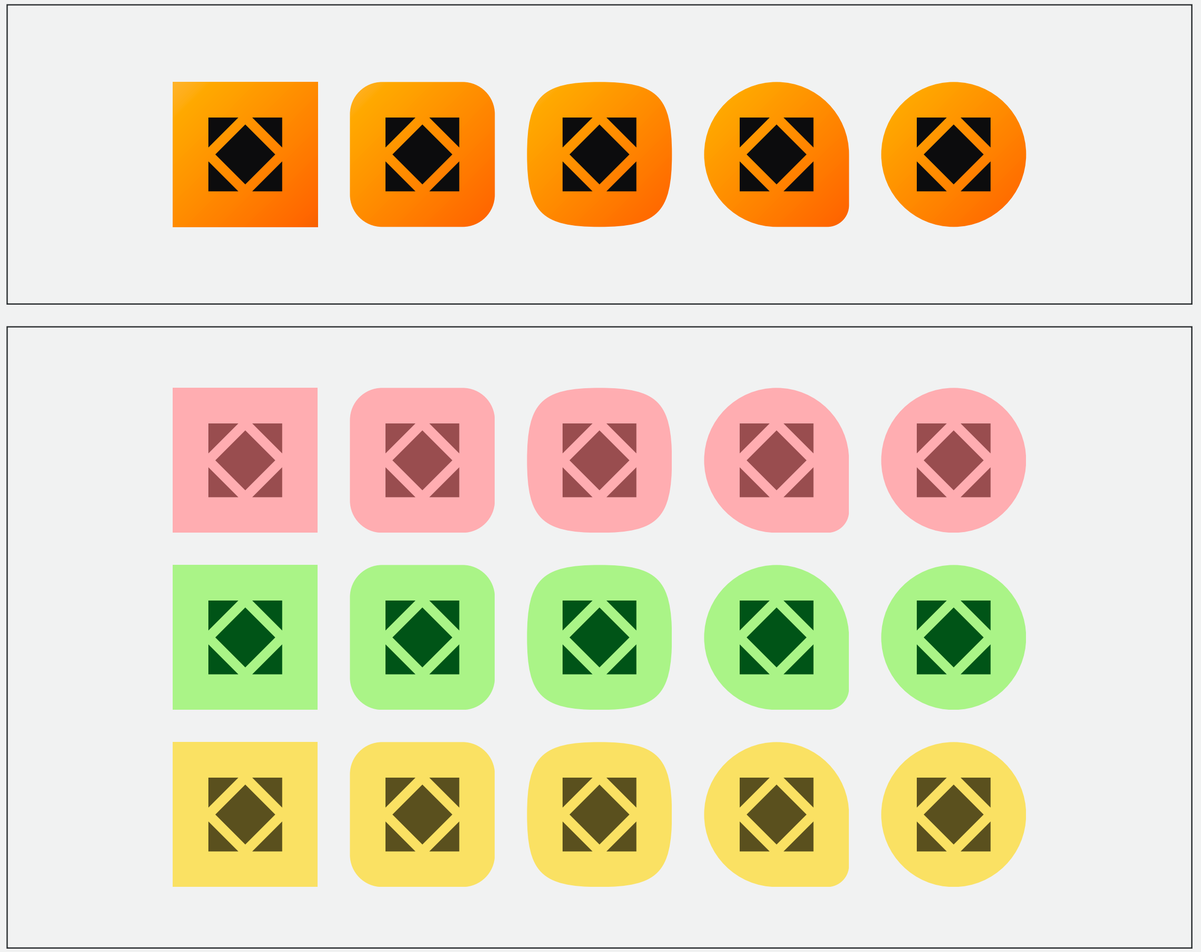
The goal is not to resist the platform but design something flexible that still feels like MOindi. In contexts like Liquid Glass, tinted icons transparencies, and effects outside our system is expected. This is not a loss of control, it's part of the environment.

The app icon is available and has been designed according to Apple's recommended approach using Icon Composer.



App Icon

Android



Android gives users a lot more customization. The same icon can appear in 5 different shapes depending on the device and user settings.

Because the icon lives inside Android’s system, it needs to adapt to the environment rather than fight against it. For example, a gradient can be added in the background to match Android’s visual language and their Material Design principles.

Android also allows users to make custom tinted icons. This is not a loss of control, it’s adapting to the larger system.

Graphic Elements

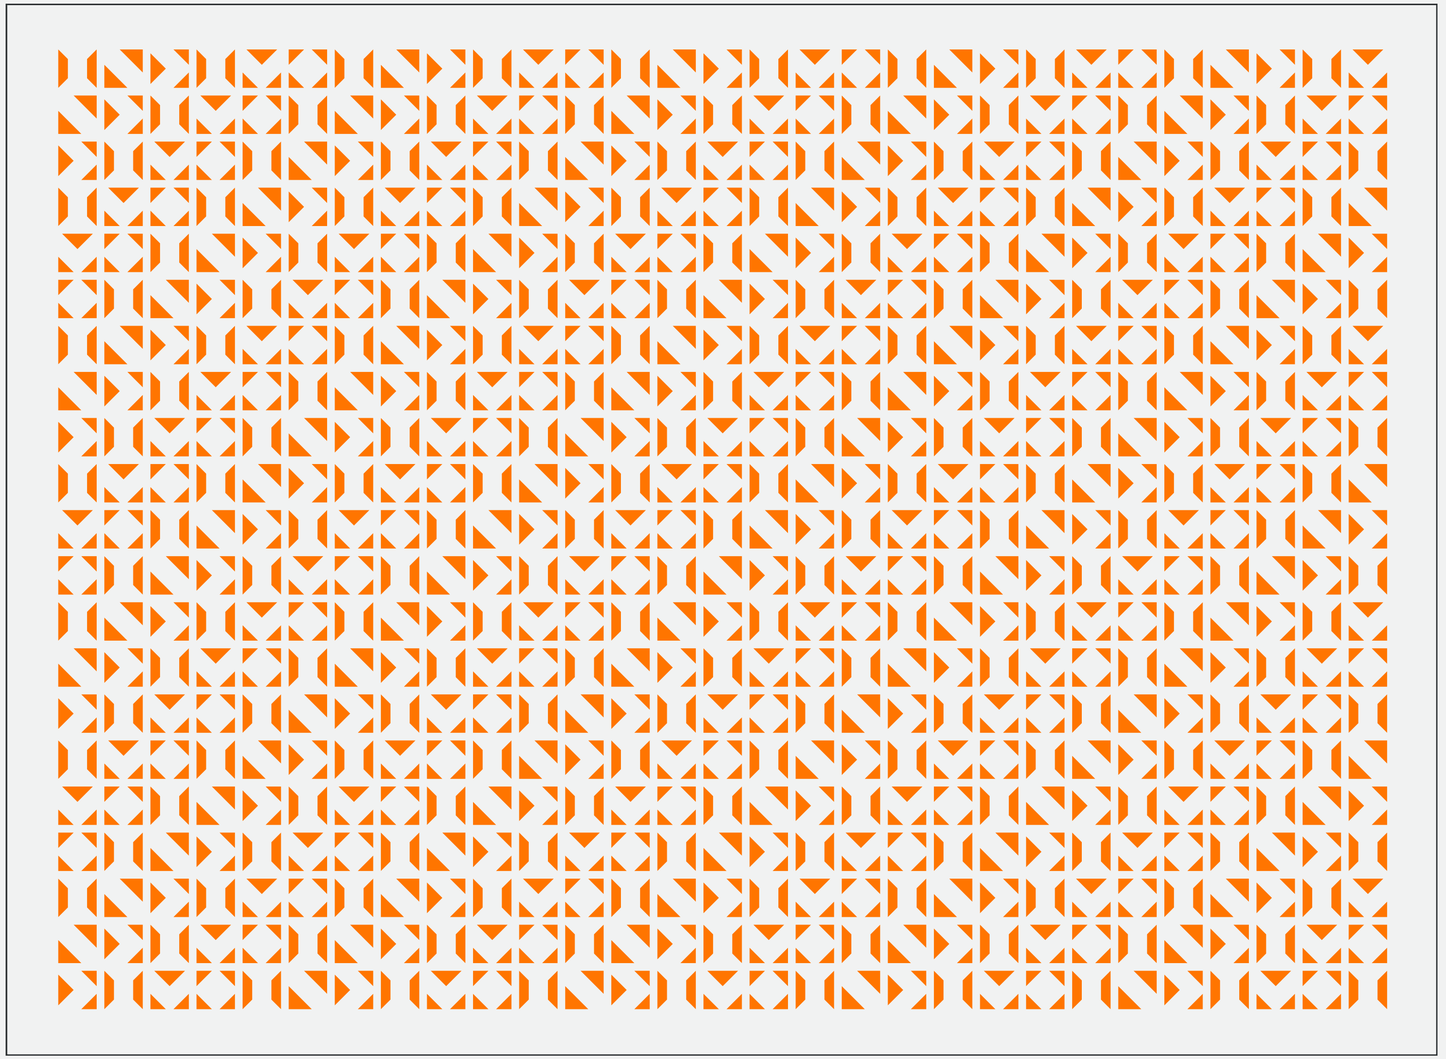
Your name is only a representation of you in text. But you can also be identified by your face or your voice. They alone are not complete pictures of you, but they are related and reinforces your identity.

Graphic elements work the same way. When used consistently, they increases brand recognition and reinforce the character of the brand.

They exist to support the composition and add structure. Their purpose is to guide attention and create visual anchors, not to compete with the identity system.

Use them deliberately. If overused or applied without purpose, they can have the opposite effect and weaken the identity.

MOindi Grid

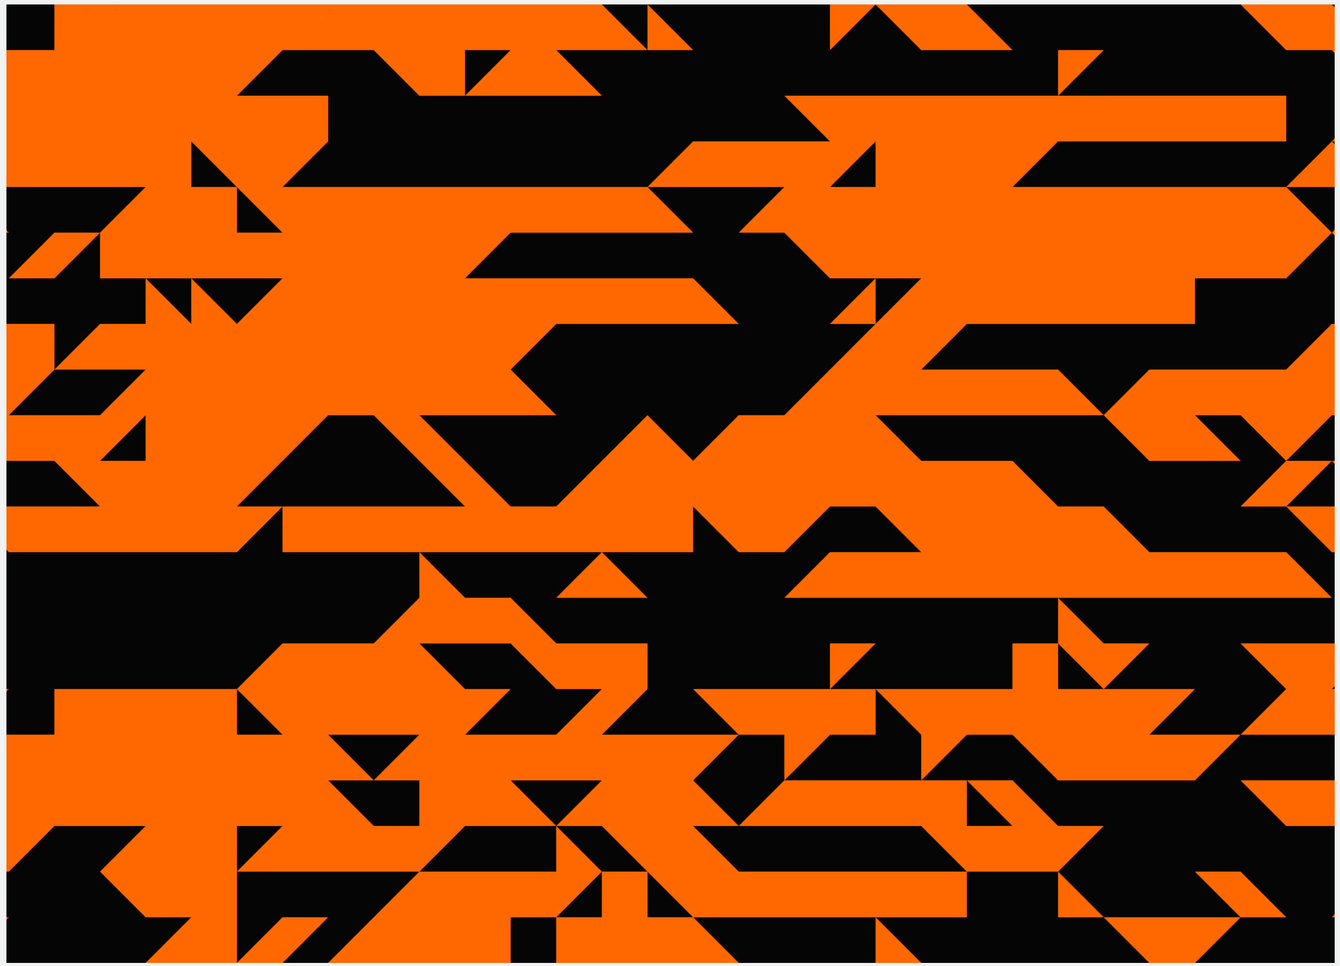


This pattern is made by repeating the typemark in a fixed sequence. **It is not random. Do not reorder or randomize the arrangement.** Each row shifts one character and makes a continuous grid that's legible vertically and horizontally.

It's not a background texture. It should be treated as an extension of the typemark because it **is** the typemark repeated in a sequence.

The surface where it's placed becomes part of the identity.

Angle Array

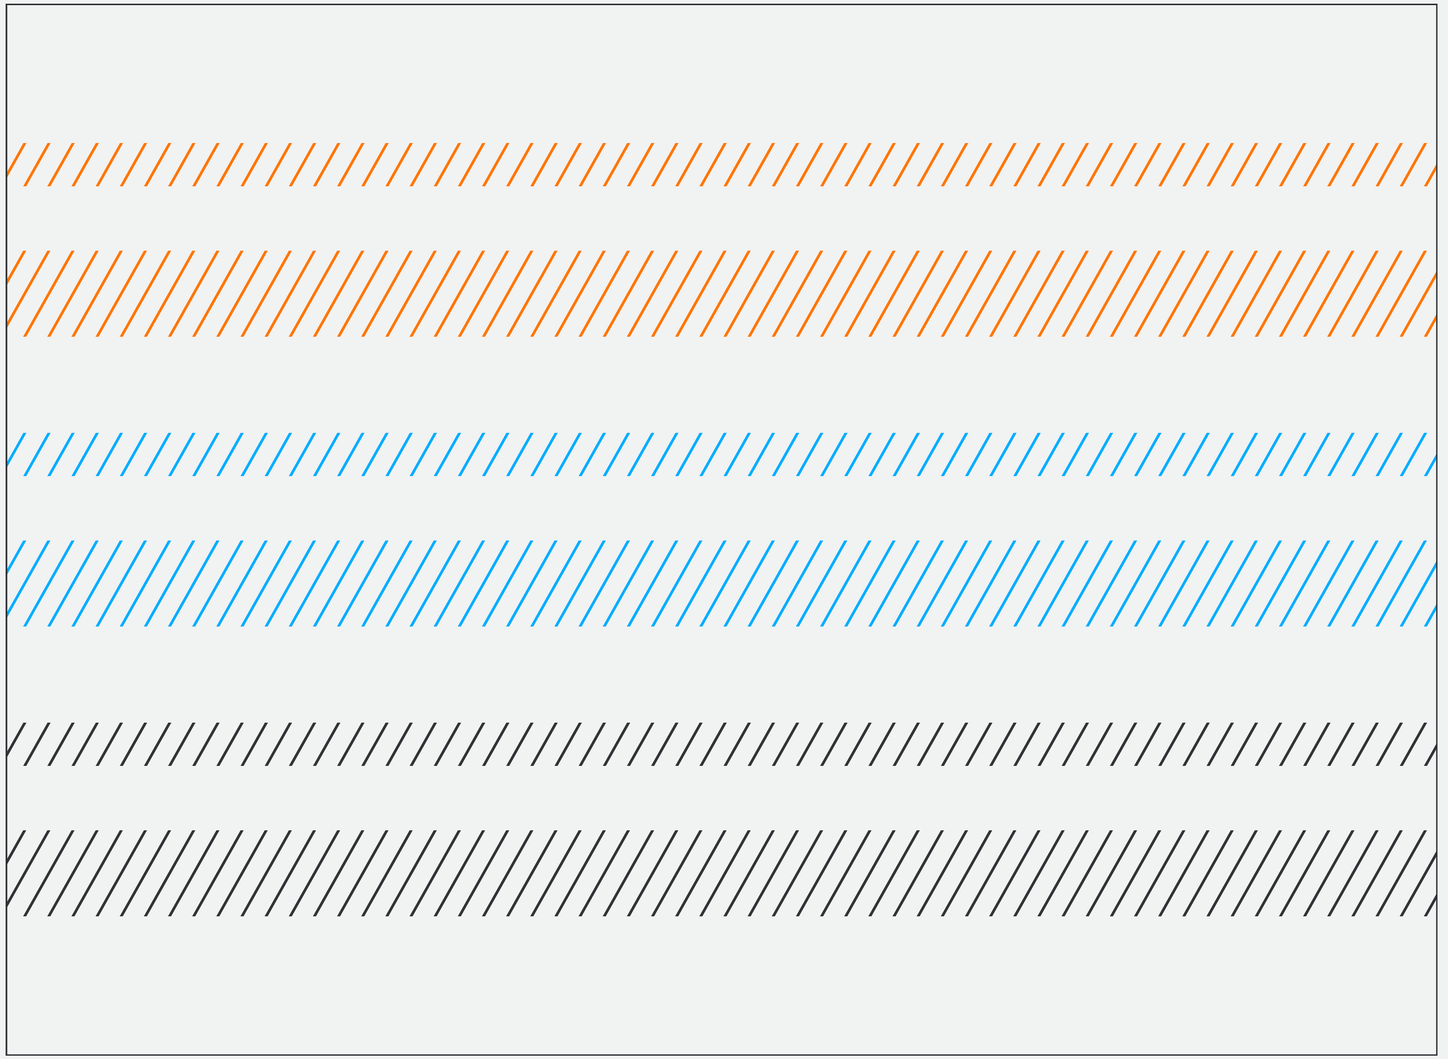


This pattern is generated from a set of 6 base tiles using a weighted system of controlled randomness.

It should be used deliberately as part of the composition to fill surfaces where a blank background would feel empty.

Don’t use it just because space is empty. Use it as a visual anchor.

Slash Pattern



This is a versatile graphic element. It can function as a frame, visual anchor, separator, or a visual cue that the area is reserved for a specific purpose (e.g., backdrop for the bar charts in our platform).

The angle, stroke, and spacing were deliberately chosen to suggest forward movement while reducing the Zöllner optical illusion.

Do not recreate it. Use the approved asset from our Figma components library.

Boxes

This is far from a unique graphic element to our brand. It’s just a box. But it appears often across the platform, so it’s worth explaining the intent and rules for it.

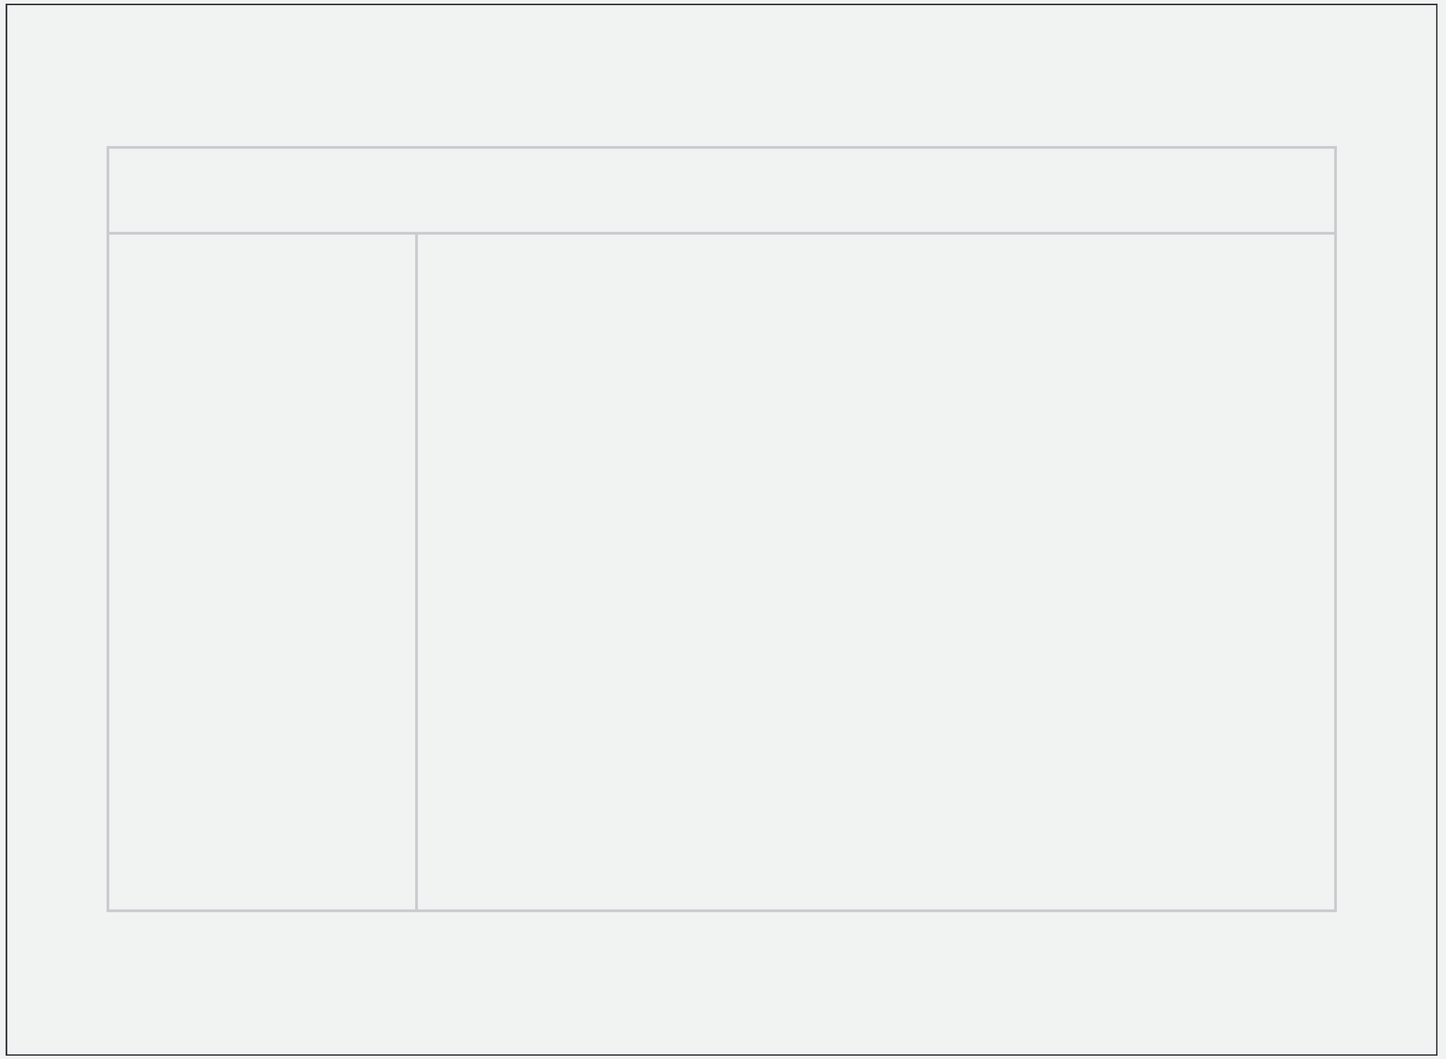
Think of it like a bento box. Boxes inside a box. The container should always be fully filled. There should be no empty areas. All inner elements are rectangular. No irregular shapes or polygons.

The boxes create hierarchy and group related content and separate different information.

Borders should be one consistent color and kept subtle so that it doesn’t compete with th content.

Limit the structure to 2 levels. One main container and one level of nested boxes.

All corners are 90°, never rounded.



Typography

There are three typefaces:

- Space Grotesk
- Space Mono
- Roboto Flex

Space Grotesk and Space Mono are the default system. Roboto Flex is used when legibility becomes the priority.

Key principles

- Default to Space Grotesk
- Use Space Mono for numbers and buttons
- Use Roboto Flex when readability is the main purpose

Space Grotesk

Primary typeface for most use.

Use for:

- headings
- short text
- general UI and layouts

Default unless there is a reason to switch.

Adjust tracking with size. Larger headings use tighter tracking. Smaller text stays neutral or slightly looser. Adjust or balance, not for visual effect.

Space Mono

Use when content is primarily numeric or requires alignment.

Tabular figures align numbers vertically, making comparison easier.

Use for:

- tables
- charts
- financial data
- number-heavy layouts

If the content is mostly numbers, use Space Mono.

Buttons are always set in Space Mono, uppercase.

Roboto Flex

Use only when the content is:

Long-form text

- More than ~2–3 paragraphs in a single block
- Or exceeds ~300–500 words in one continuous reading section

Reading-first content (not interface content)

- Letters, articles, essays, explanations, documentation-style text
- Anything designed to be read continuously, not scanned

Do NOT use Roboto Flex when:

- content is UI (buttons, labels, forms)
- text is short or scannable
- typography is part of brand expression (headings, identity moments)

Color System

The color system defines how each color functions and how defaults behave.

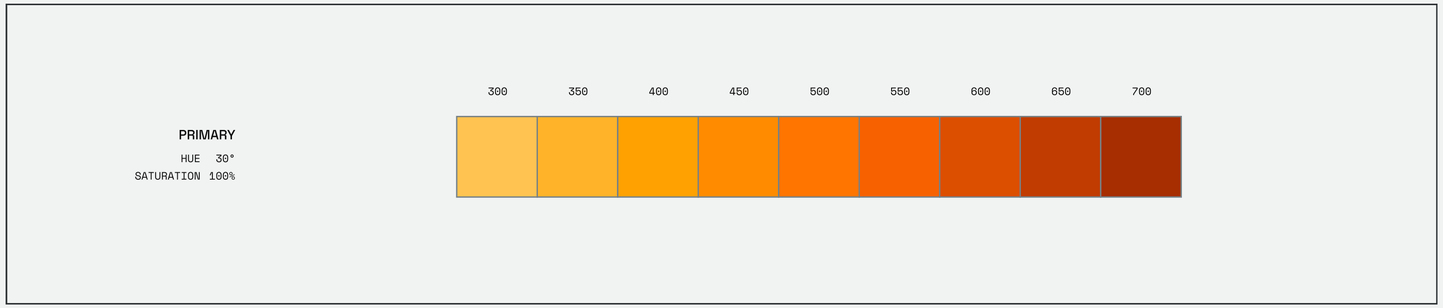
The system is developed with an app-first approach, using P3 color by default for modern displays. If a screen doesn’t support P3, it falls back to standard sRGB. The colors still maintain the same function and meaning.

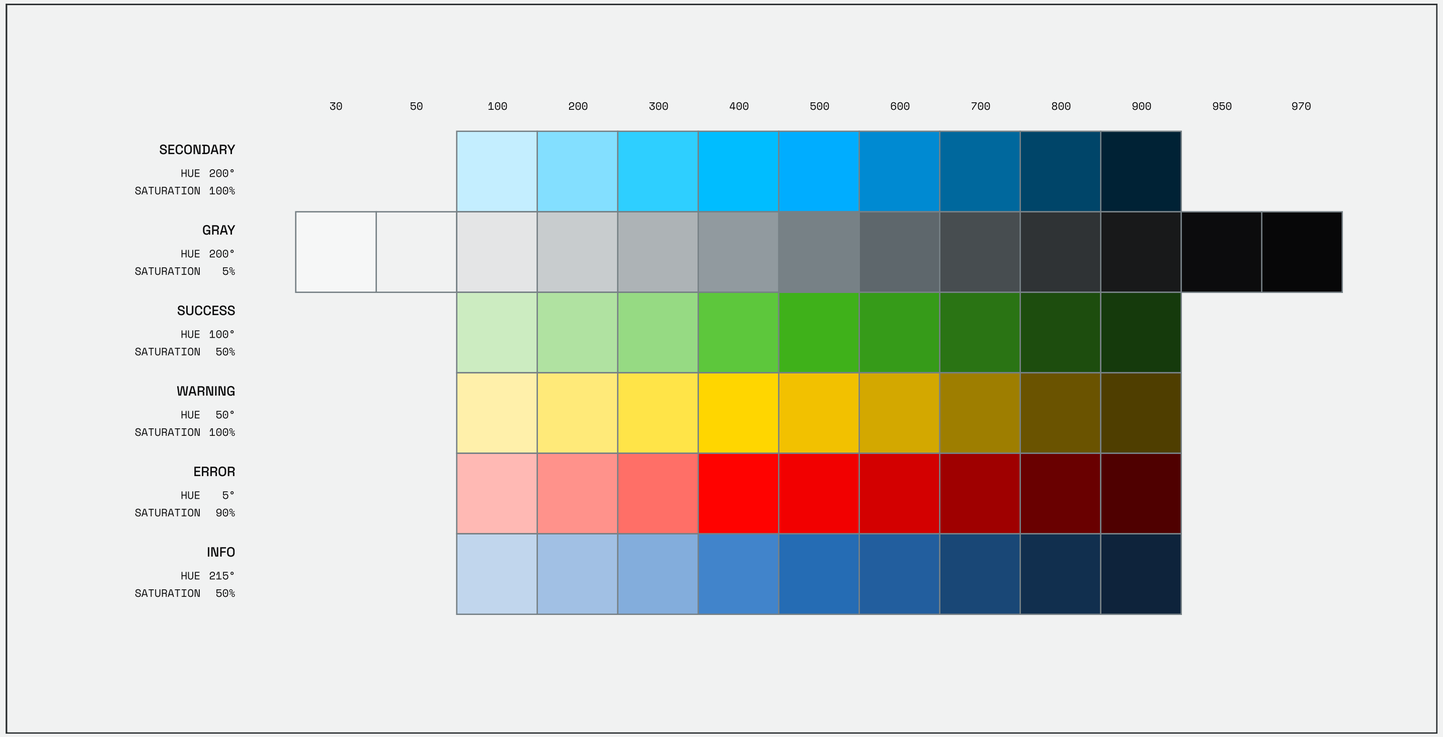
For physical reproduction, Pantone and CMYK are defined as a separate, purpose-built palette rather than a direct conversion from the P3/RGB system.

Core Rules

- No pure black or pure white
- Grays are slightly tinted, not neutral
- Color steps are consistent
- Functional colors are for system states, not decoration
- Light and dark mode are both part of the same system
- Dark mode uses a tailored palette, not an inverted scale
- Colors should behave the same in product and marketing
- Use Pantone/CMYK palette when the intended medium is physical

Palette





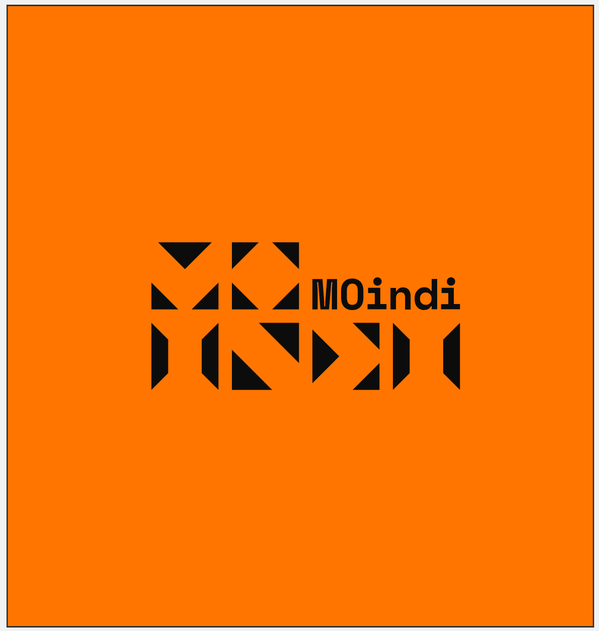
The palette has been designed for screen-first use and follows a conventional color scale naming system.

The primary color uses a reduced range with 50-step increments between 300–700 and there's a shift in hue. The grayscale is extended beyond the standard range to replace pure white and black.

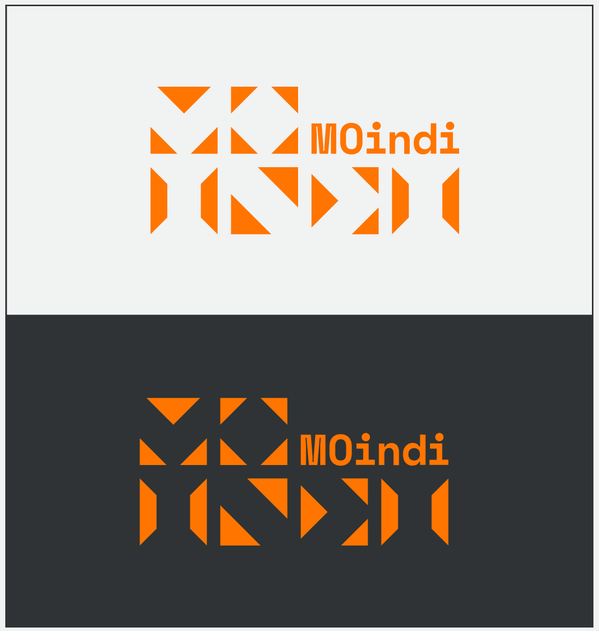
Color primitives and semantics are available in the MOindi Figma library.

Brandmark

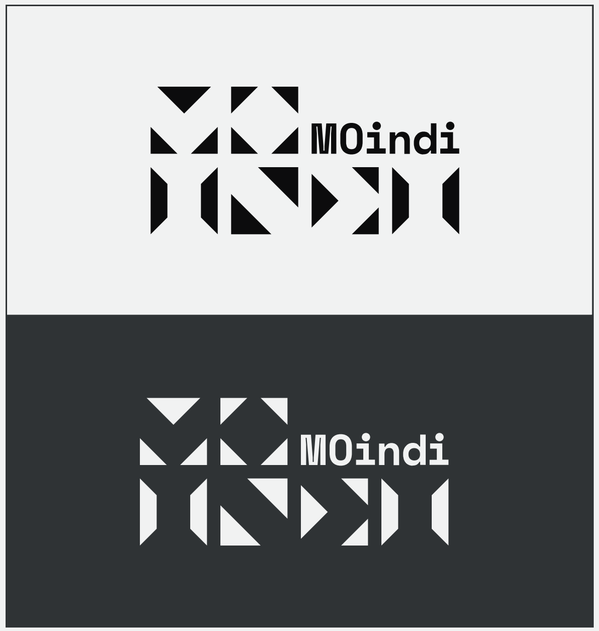
Color is another element of brand recognition and should be applied consistently. If following the rule doesn't work in context, it can be adjusted. Just keep the original intent in mind: clear, recognizable, and consistent.



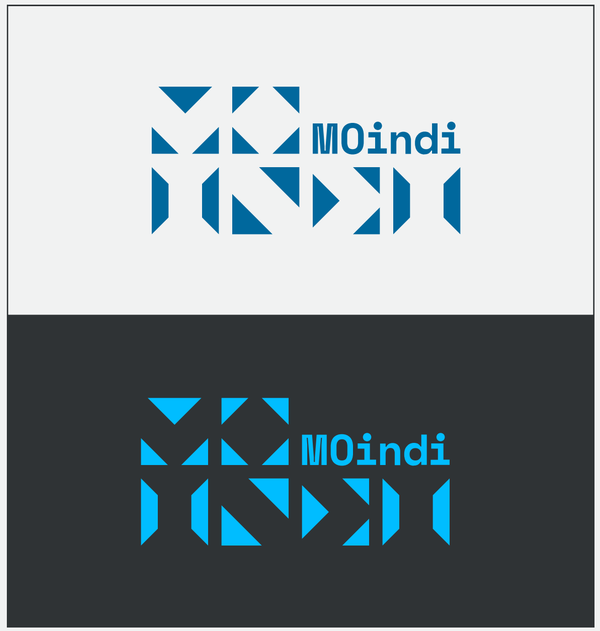
- The most preferred color scheme is the brandmark in Gray 950 on a Primary 500 surface. A surface can be added if there isn't a suitable surface to place the brandmark.



- In other situations where the composition is mostly white or black, the brandmark in Primary 500 is preferred.



- If a color version is not possible the next choice should be either Gray 50 or Gray 950



- The secondary color is available, but this should be used when previous options don't work. Note that the secondary color has different values for light and dark contexts (Secondary 400 for light and Secondary 700 for dark)

Primary Color

By default, it's used sparingly so that its impact is higher when it appears. For example, a primary color CTA button won't stand out if every header is in the same color.

However, the primary color could take over a whole layout, like in banners or bold promos to draw attention.

But don't use it everywhere that it loses its meaning and significance.

Color Hierarchy

- Base (light/dark) is the background
- Different grays show information hierarchy
- Secondary colors is the go-to color in most cases
- Primary color is reserved for the most important thing

Primary color is used when something matters in that moment.
What that is depends on the context.

Functional Colors

Success, warning, error, and info are functional colors are intended to be used for states within the app.

They are not additional colors available to be used as decoration.

Grayscale System

Pure black and pure white are not used.

- Gray 50 replaces white
- Gray 950 replaces black

Grays are slightly tinted so they don't feel harsh or separate from the rest of the system.

Dark Mode

Dark mode isn't created by inverting the scale (100 → 900, 200 → 800, etc). Instead, a palette has been selected to keep the same perceptual relationships between tones. This keeps hierarchy, contrast, and depth consistent between light mode and dark mode.

Print Colors

For any design intended for physical reproduction, always begin with the Pantone colors.

The CMYK values here are what Pantone provides, but because CMYK inks vary wildly, it's best to design with Pantone values and let the producer match the actual reproduction's color to the Pantone standard.

Only use CMYK when Pantone can't be used. Always reference the Pantone swatches and make adjustments to get as close as possible to the Pantone standard.

Pantone

1365 C	2013 C	1505 C	1525 C	1535 C
545 C	543 C	2925 C	540 C	539 C
427 C	429 C	430 C	432 C	433 C

CMYK

0, 28, 79, 0	0, 39, 100, 0	0, 67, 100, 0	0, 77, 100, 14	0, 71, 100, 38
20, 3, 0, 0	35, 7, 0, 0	75, 18, 0, 0	100, 53, 0, 65	100, 43, 0, 83
14, 8, 4, 0	35, 23, 19, 2	50, 34, 27, 11	78, 57, 39, 56	88, 63, 40, 85

Creative Direction

This section defines how the brand should look and feel across everything we make. It sets the intent behind the work, not a fixed visual style.

There are a few hard rules in place, but most of this is about direction and attitude rather than strict visual uniformity. Different outputs can look different depending on context, but they should all feel like they come from the same system.

The focus is on intent over consistency of appearance. What matters is that the work carries the same sense of control, tension, and clarity, even when the execution changes.

Overall visual attitude

- Controlled, not polished
- Tense, not decorative
- Clear, not loud
- Real, not staged

Composition principles

- Intentional, not decorative
- Hierarchy is clear without exaggeration
- Imbalance is allowed when it creates tension
- Nothing feels overfilled or forced

Imagery direction

- Documentary style, not staged or polished
- Real environments, not abstract renders
- People over symbolism
- No stock imagery
- No AI slop
- Small imperfections that feel human are great, but not technical errors or noise

Motion & energy

- Controlled movement, not flashy
- Motion is always motivated and functional
- No artificial linear motion
- Movement should feel physically grounded (momentum, friction, inertia)
- Nothing moves purely for effect

Typography behavior

- Text is always a statement, never decoration
- No styling tricks
- No “designed typography” effects
- Text is direct, readable, and functional
- Hierarchy comes from size, spacing, and opacity

What to avoid

- Corporate tech aesthetic
- Lifestyle advertising language
- Overly inspirational framing
- Random visual chaos
- Over-designed or over-stylized visuals

References

These are not styles to copy.

They are references for how the intent and ideas behind our brand show up in different contexts, styles, and movements.

Each example points out what to **take** and what to **leave**, what fits our brand and what doesn’t.

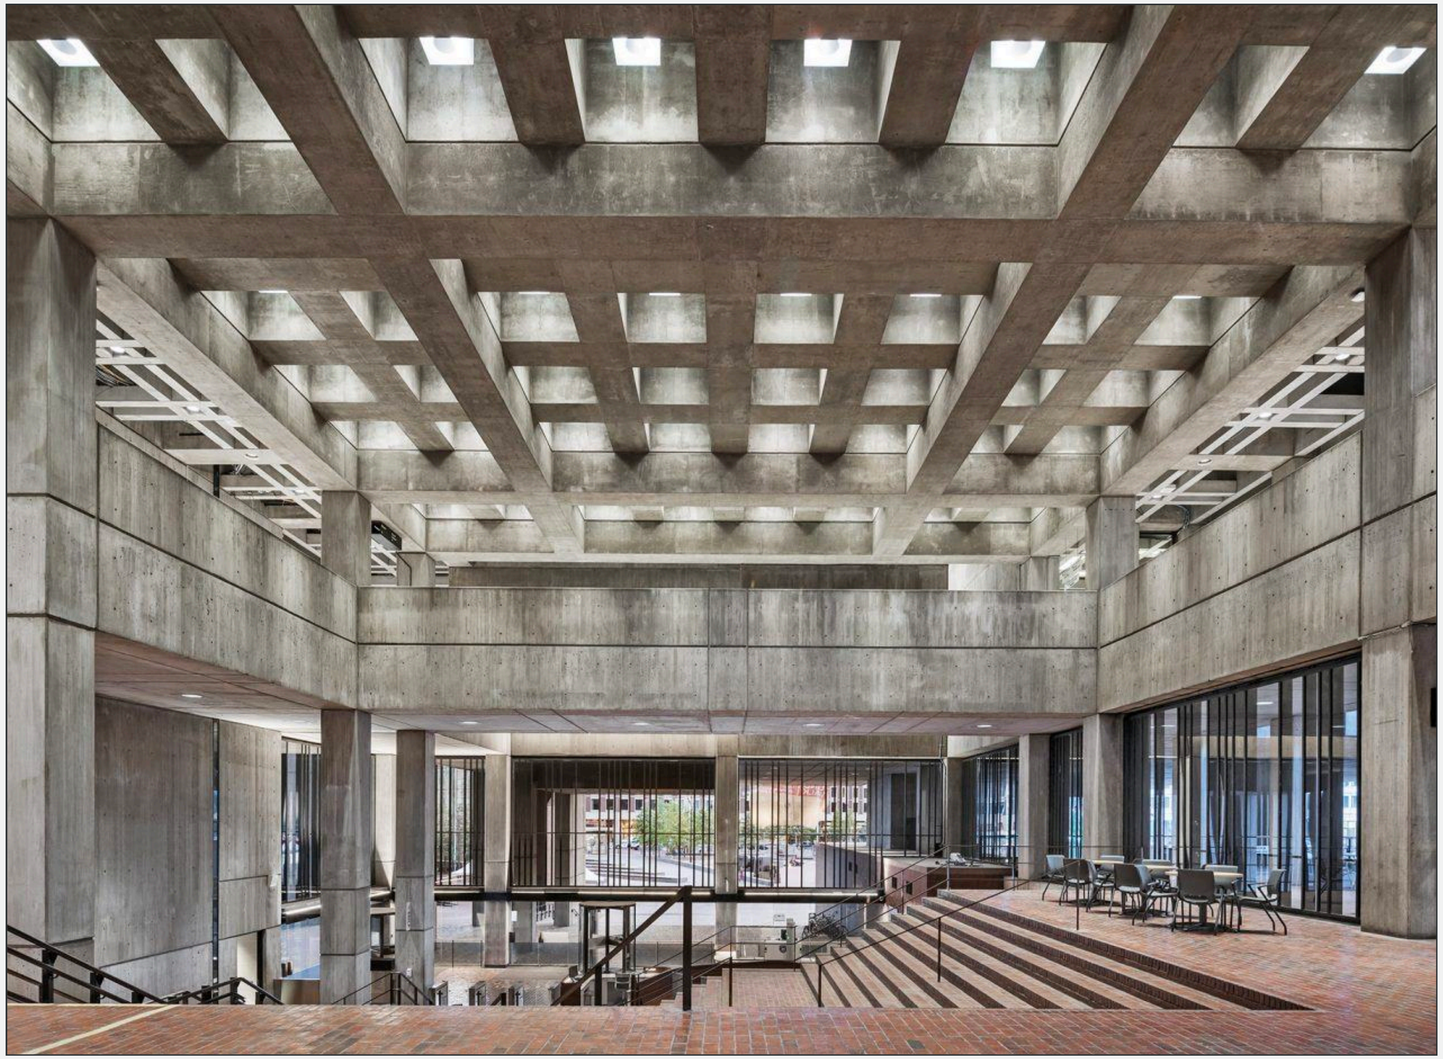
Brutalism

Take

- No decoration or disguise
- Honesty in material and structure (doesn’t pretend to be something else)
- Order and structure

Leave

- Making things feel oppressive or heavy
- Using rawness as a gimmick instead of principle
- Aggression for aggression sake



Street Photography

Take

- Real moments of spontaneity
- Presence, not performance
- Imperfection as evidence of truth

Leave

- Staged authenticity
- Cliches of urban grit or stylized drama
- Sloppiness disguised as truth

Left
Real and spontaneous. Genuine interaction captured

Right
Presence in the real world. Not perfect but the composition and structure are deliberate

Left
Staged authenticity. Posed. Person is performing.

Right
No presence, unmotivated dutch angle, nothing interesting happening, just sloppy.

Swiss / International Style

Take

- Clarity above all
- Systematic logic
- Hierarchy through spacing and size

Leave

- Reduction that removes all character
- Lifeless sterile simplicity
- Rigid uniformity

Clear hierarchy of information through size and systematic layout

Simplicity that becomes lifeless and has no character

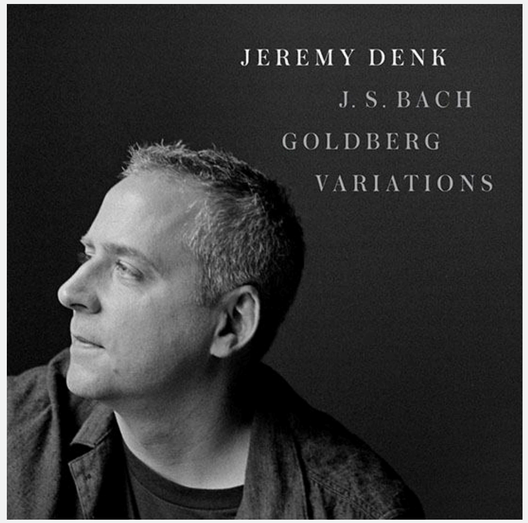
In terms of music, we are closer to...

Igor Stravinsky

Le Sacre du printemps

- Structured disruption
- Controlled tension
- Doesn't perform emotion, it's engineered

Listen on Apple Music Listen on Spotify

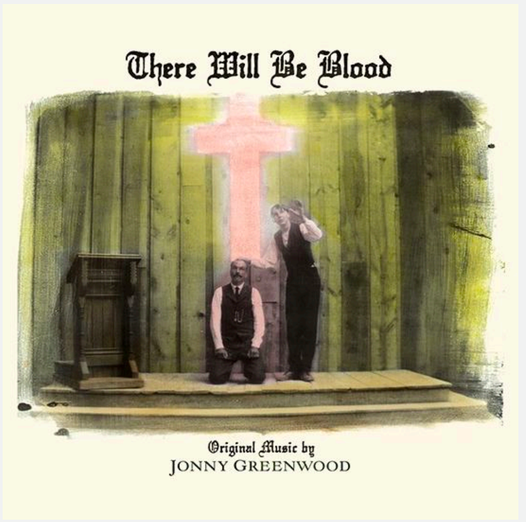


J. S. Bach

Goldberg Variations

- Structure structure structure
- Emotion embedded in form, not expression
- Everything is intentional

Listen on Apple Music Listen on Spotify



Jonny Greenwood

There Will Be Blood

- Minimal, tense, structural
- No cinematic manipulation for emotional effect
- Subdued, not bombastic

Listen on Apple Music Listen on Spotify

... than we are to...

Hans Zimmer

Interstellar

- Built around emotional escalation and release
- Organ used for grandiose religious effect
- Expansive large sound for pure effect

Listen on Apple Music Listen on Spotify

Richard Wagner

Der Ring des Nibelungen

- Massive emotional spectacle
- Music made to overwhelm
- Zero restraint, all dramatic effect

Listen on Apple Music Listen on Spotify

Thomas Newman

American Beauty

- Everything is mood driven, not structure
- Soft and atmospheric
- Curated feelings, not system logic

Listen on Apple Music Listen on Spotify

Example Script

This script is intended to show what a TV ad made by us should feel like. It's an example of the brand's tone, attitude, and character.

We'll break down how this fits our brand's voice.

We think it's unfair that you need to sign with a label to see mainstream success.
We think it's unfair that a handful of "kingmakers" decide who gets heard.
We think it's unfair that you're not given a seat at the table.
We think it's unfair that you can't invest in the artists you believe in.

We think the music industry got hijacked by a bunch of people who saw culture as something to extract from, and changed it layer by layer to separate artists from the people and put themselves as the only way through between them. To profit. Not to build culture. Never giving a shit about quality, only quantity. Dollars. Their dollars.

And now they decide what you should listen to (hint: it's whatever makes them more money).

We think this is bullshit, so we're doing something about it.

Let the people decide how culture is built. What type of sound their generation is remembered by. Give every artist a fair chance to succeed. Artists can raise money by offering their catalog directly to anyone who wants to invest. Investors can help shape the culture they choose to be part of. Without executives. Without big corporate labels.

No more gatekeepers.
Invest in the music you love.
Earn royalties together.

Analysis

Direct, repetitive

- “We think it’s unfair...” repeated intentionally
- Creates rhythm through insistence, not explanation

No persuasion

- Not seeking approval
- States conditions of the system as reality rather than opinion

No softening

- “this is bullshit” is direct and breaks expected corporate tone
- Meets “don’t soften meaning and “clarity over elegance”

Assumes intelligence

- No over-contextualizing of the industry
- Logic not explained beyond what’s necessary

Emotional tone

- High energy, not chaotic. Repetition builds intensity but stays in control
- Direct, not performative. No decorative language or stylistic fluff
- Confident, not loud. Intensity is structured rather than expressive outburst
- Grounded, not polished. Unrefined language creates realism and skips the over-polished sterile corporate tone
- No hype or inspirational-lifestyle language. Simple words

Archetype

Rebel (Structured)

Controlled

- Not emotion driven
- Focus on the system’s shape rather than individuals
- Rejection of a broken system, not destruction for its own sake

Constructive

- Critique followed by a better alternative system
- Rejection of the idea that culture requires permission

Change, not chaos

- Rejection of the status quo
- Not anti-system
- Not anarchy
- Systemic change through changing who gets to move money, attention, and culture

Core attitude

- Behavioral rebellion, not philosophical
- Actionable stance, not abstract

Creative Boundaries

There are 3 degrees of freedom

1. Freedom
2. Direction
3. Limits

Think of **‘Freedom’** as the furniture in the building. These can change depending on the campaign, regional localization, and it’s the layer that allows a lot of creative freedom. They don’t need to all look the same, but it also can’t be a mishmash of wildly different styles.

Think of **‘Direction’** as the building that the furniture lives in. This is the current identity of the system. It can only only if the entire brand’s direction changes.

Think of **‘Limits’** as the laws of gravity. Violating these breaks the very philosophical idea of the brand existing in the first place.

Freedom

These elements can change. Be as creative as you want.

- Visual execution
- Campaign storytelling
- Regional localization, not just translation
- Cultural references and framing
- Composition and style

Direction

These are the defining characteristics of our current direction. They are your north star and should not be changed unless the entire brand's direction changes.

- Core attitude
- Voice principles
- Fixed elements
- Structural stance (artists+fans vs gatekeepers)

Limits

These completely break the core idea of the company existing in the first place. Do not go anywhere near it.

- Permission-based framing of culture
- Passive audience positioning
- Over-polished corporate tone
- Emotional performances as manipulation
- Ignoring system forces (money, attention, control)

Do / Don’t

This is the most important section for understanding the brand quickly. It’s not exhaustive, but going through this section will give you a good baseline understanding of what works and what doesn’t.

It uses real examples to show correct and incorrect usage. Looking at these should give you a strong sense for how things should feel, how they should be made, and how to keep everything consistent so it feels like it comes from the same place.

The goal here is to remove ambiguity, not to cover every edge case. If something isn’t shown here, go to the relevant section and it will most likely explain the principle or intent behind it.

But if there are still questions, don’t assume it falls under the “Freedom” layer.

Just ask.

Tone

Example 1

	✓ The brand is not defined by what it says it is, but by what it consistently does. That behavior is what builds the image and character that others assign to it.
Buzzwords like “execution,” “deliver,” “compounds,” make it sound corporate.	✗ The brand is defined by execution, not narrative. It’s what we consistently deliver that compounds into perception, shaping a clear and durable identity in the market. Every action reinforces the signal, building the character others come to recognize, trust, and scale with.
Phrases like “how it presents itself” makes the message not direct. Words like “constantly evolving impression” sound like they’re trying to sound important. Inflated language with “endlessly” or “highly”	✗ The brand is endlessly shaped by how it presents itself, how it frames its identity, and how it chooses to speak about what it is. Over time, these expressions accumulate into a constantly evolving impression, creating a layered and highly articulated sense of image and character in the minds of others.
It uses motivational filler like “that’s something powerful” and “clarity always leads to success.” Focuses on emotional message instead of the message.	✗ The brand is defined by what it does, and that’s something powerful. Every action matters, every output adds up, and everything you put into the world becomes part of the story people see and feel. It all works out as long as you keep showing up and staying aligned, because consistency naturally turns into clarity, and clarity always leads to success.
It uses big words for no good reason.	✗ The brand is not primarily constituted through its explicit self-description, but rather through the cumulative behaviors over time. These actions function as the principal basis from which external observers derive an identity and character.

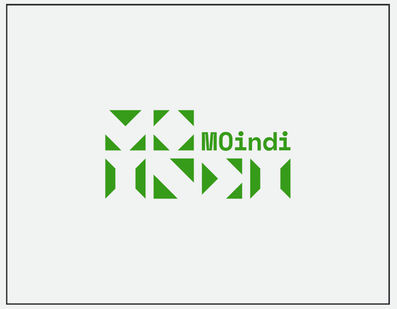
Tone

Example 2

	✓ The real issue is that there is no way for artists and fans to organize in a direct, coordinated way that can compete with the major players in the industry.
Asking rhetorical question is performative. Softens the original problem. Uses buzzwords like “alignment.”	✗ What if artists and fans could actually move together in real time, with real coordination, at a scale that stands alongside the biggest forces in the industry? Right now, that kind of seamless alignment still doesn’t exist in a simple, accessible way.
Using too many absolutes and definitive language like “blocked,” “simply cannot” makes the situation feel more extreme and comes across as too persuasive.	✗ The real issue is that artists and fans are fundamentally blocked from any real form of direct, coordinated organization, and this gap is exactly what keeps them from ever being able to compete in any serious way with the dominant players in the industry with an advantage and scale that simply cannot be matched.
Adds redundant adjectives. Uses different phrases like “come together, coordinate their actions, and organize themselves in a shared direction” to describe the same thing.	✗ The real issue is that there is, at present, no clearly defined or consistently functioning way for artists and fans to come together, coordinate their actions, and organize themselves in a shared direction that would allow them to collectively operate at a level comparable to the large, established organizations that currently dominate the industry landscape.
Phrases like “may be” and “might also be” shows a lack of conviction. Using “or” in “very clear or consistent way” shows that it’s not clear to them what the real issue is.	✗ The real issue may be that there isn’t a very clear or consistent way for artists and fans to organize together in a coordinated way that could really compete with the larger players in the industry, or at least not in a straightforward sense. It might also be that the existing structures just don’t naturally support that kind of alignment yet.

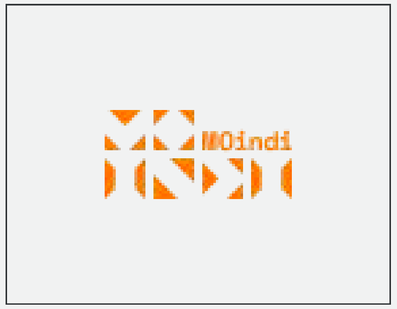
Incorrect

- low contrast, poor legibility

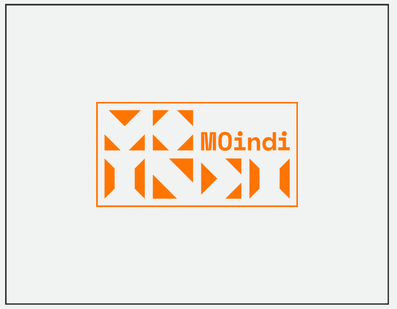


- use of functional colors meant to be used for states

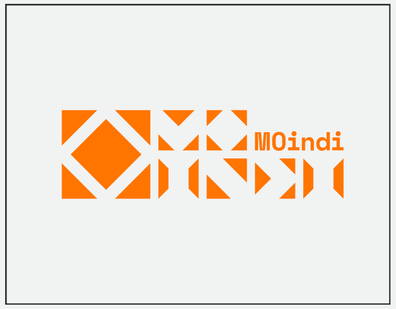
- effects



- using rasterized pixelated brandmark



- added a border

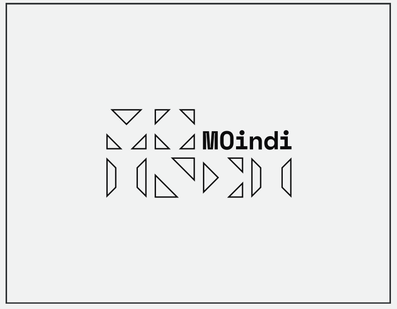


- icon used together with the lockup

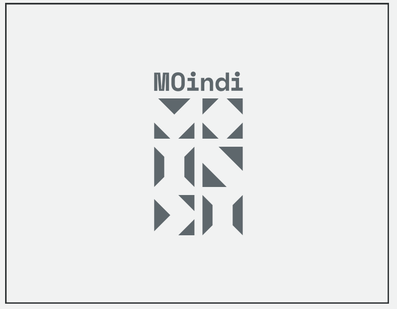
- tilted

- stretched
- wrong proportions

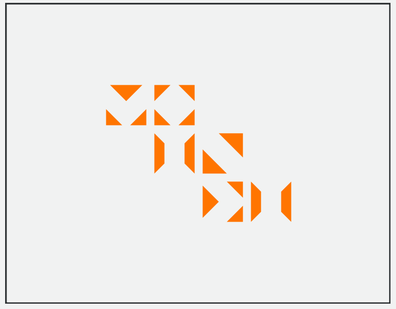
- individual square has a different color



- outlined



- combined 2x2x2 with the wordmark



- elements repositioned

Correct

- Small embossed surface wouldn’t reproduce the lockup clearly
- Embossing is the nature of the object

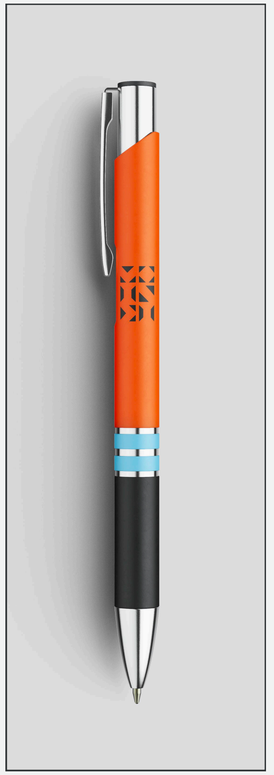
Correct

- Full orange would overwhelm the space. So it’s used on the small wall with the lockup as the focal point
- Vertical slats create a rhythm that matches the vertical typemark
- Typemark choice follows the structure of the space, not preference

Incorrect

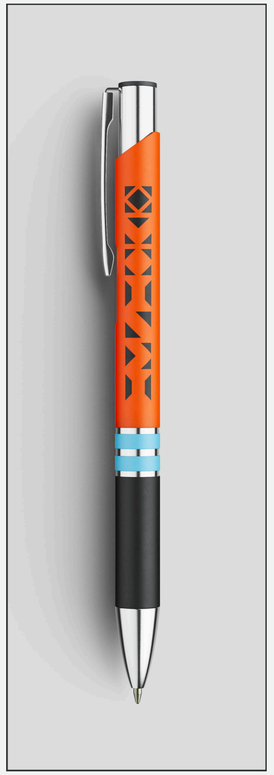
- Normally the lockup is preferred, but the format is too constrained to fit comfortably

Incorrect



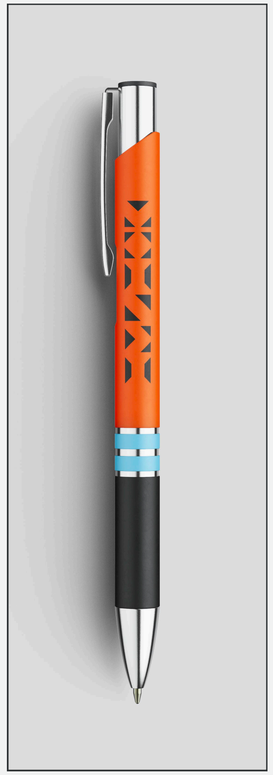
- The surface is too narrow for the 2x2x2 variant to reproduce clearly

Incorrect



- Uses a combined version of the icon and typemark

Correct



- Vertical typemark fits the context of the surface. Horizontal typemark can also work since the object doesn’t have a fixed orientation

Incorrect

- The lockup repeats information that's already there through the website
- Even thought the lockup is the default, it becomes redundant here because the brand's name is clearly established

Correct

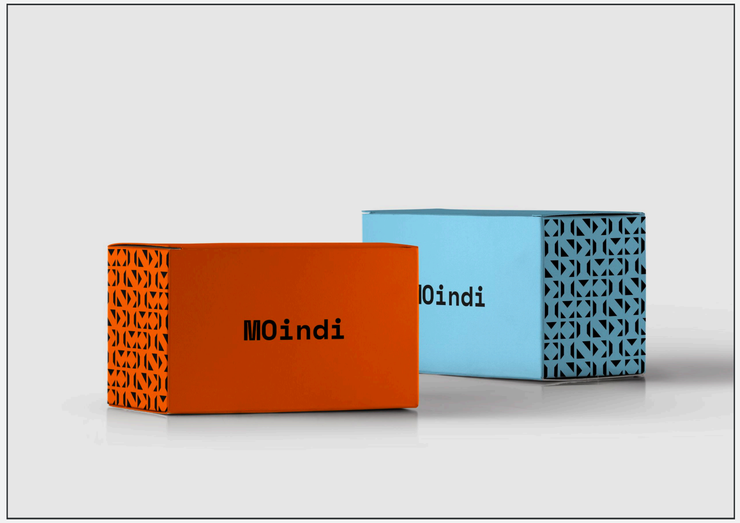
- The round button is too small for any other brandmark to stay legible
- Cord color can be either primary orange or secondary blue depending on context
- Both options are valid

Correct

- The 2x2x2 variant fits the vertical format of the banner
- Choice was driven by spatial constraints, not preference

Correct

- The horizontal format matches the natural orientation of the wristband
- Using the lockup is unnecessary since the attendees already have full context of the event, and the brand is reinforced through other touchpoints on site
- VIP gets the primary orange following the color system hierarchy

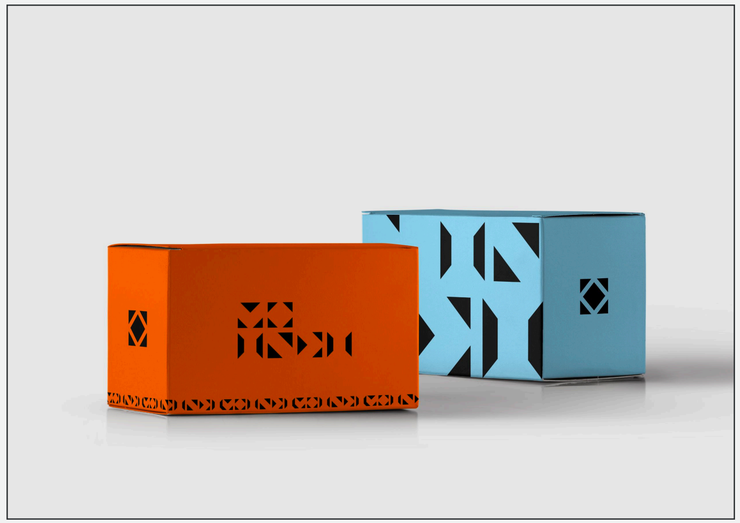


Incorrect

- The wordmark alone is not part of the identity system
- Modifying fixed elements affects recognition

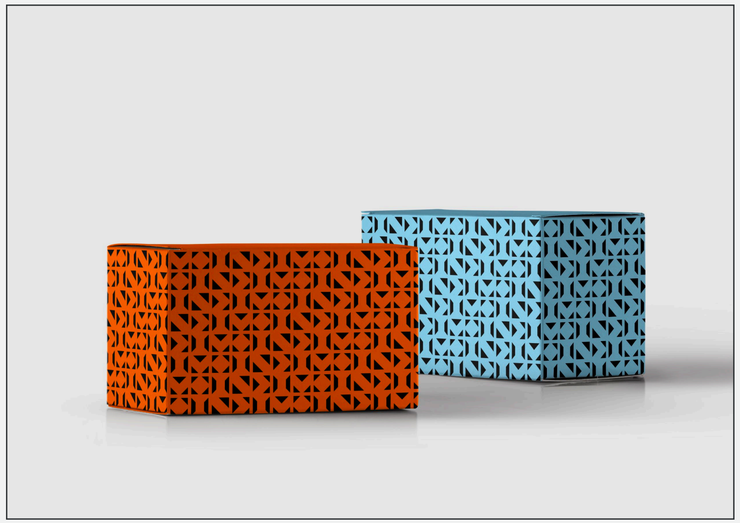
Correct

- Lockup is used as the primary identifier
- MOindi grid is used as a second element
- Both are used according to the system



Incorrect

- The icon is used even thought there's enough space for a full brandmark
- Primary typemark should be used when "MOindi" is not present anywhere else in the context
- Partial or modified use is not part of the system
- The MOindi grid and partial sections of the typemark are being used as decoration



Best

- Designed for discovery through interaction
- The box is a full identity surface, not background or second layer
- It doesn't need immediate legible identification because when in use, the user either already has the context of where this is from or will discover it as they interact with the contents
- Recognition will come from the interaction, so the lockup is not necessary

Incorrect

- The kit is light so using the primary orange creates low contrast

Correct

- Using the dark shade of the secondary blue creates higher contrast

Acceptable

- Technically correct
- Dark kit creates high contrast with the lockup in primary orange
- Uses the default hierarchy, but ignores the context
- The primary orange when combined with black and gold feels really out of place

Correct

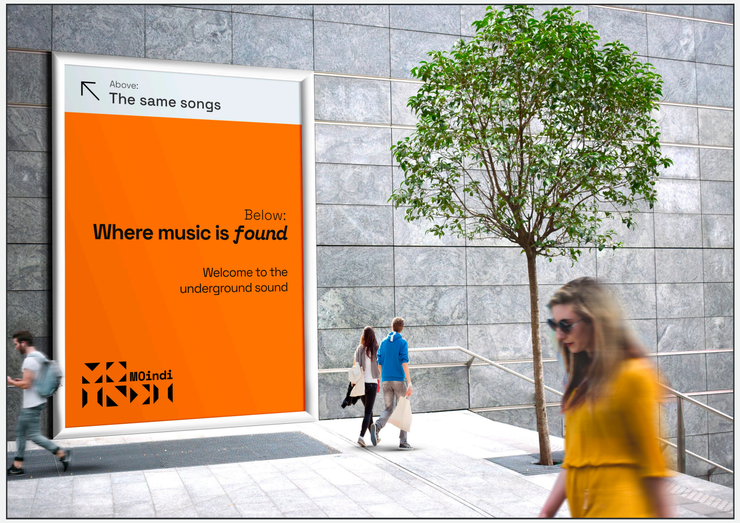
- Even though the primary orange is the default, white integrates better with the uniform's overall design
- Still legible and identifiable

Best

- The better option is to integrate our brand into the team so that it feels like a natural extension of the team's identity
- The goal is not to dominate the uniform, but to make it feel like it always belonged
- This creates a natural and positive association for their fanbase

Incorrect

- There’s no functional reason for using the directional variant
- If it’s used as waypoint symbol it would have been fine but this isn’t the case

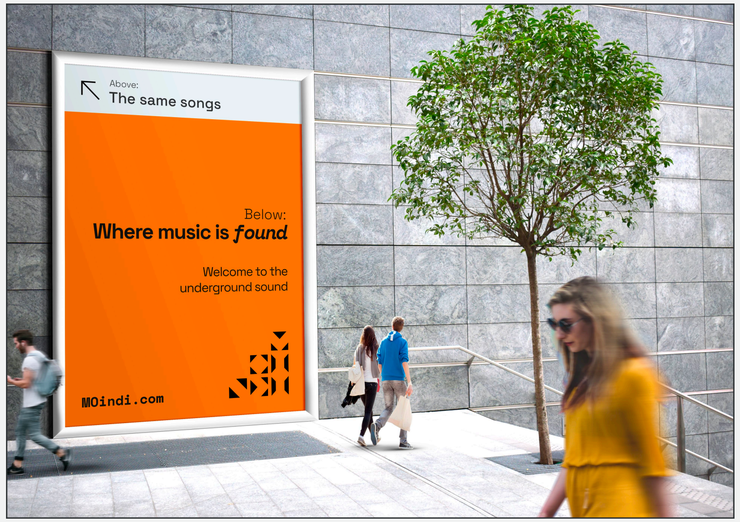


Correct

- Nothing is wrong with this, but it doesn’t take advantage of the setting and doesn’t use the context

Correct

- It uses the primary 2x4 typemark
- No need to use the lockup since viewers already in a branded environment
- This is not a touchpoint that requires additional clarification



Best

- The downward movement of people going to the subway station creates an opportunity to use the directional typemark as part of the message
- Since this directional typemark is placed in a public-facing setting, the web address is necessary
- In other internal settings or contexts where recognition is already there, the web address is not necessary

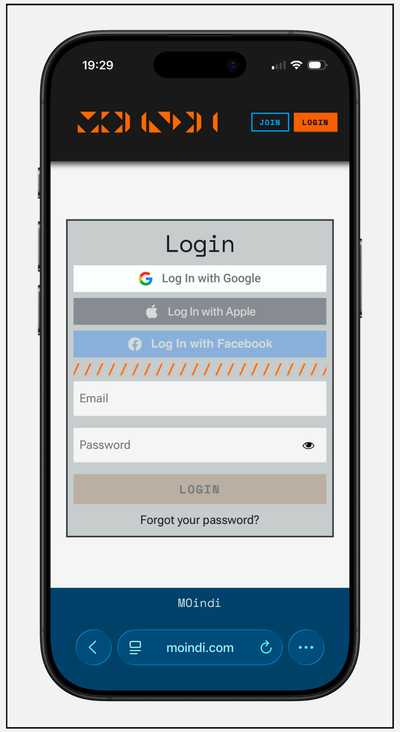
Incorrect

- The brandmark is positioned in a low contrast area

Correct

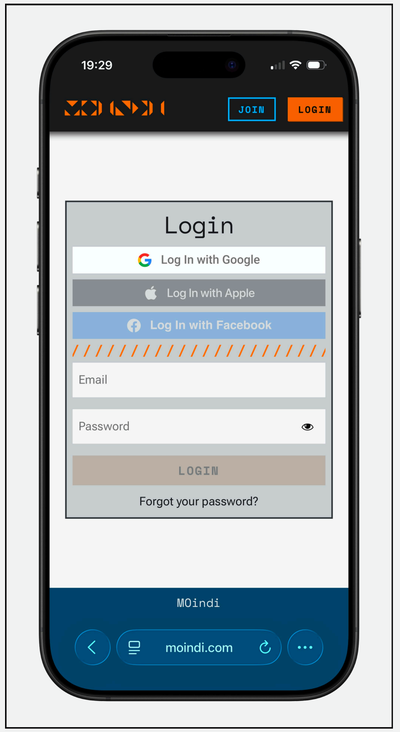
- Correct placement of the brandmark in a non busy area
- The brandmark and its clearspace behind does not need to be a solid background as long as there's enough contrast to be seen clearly

Incorrect



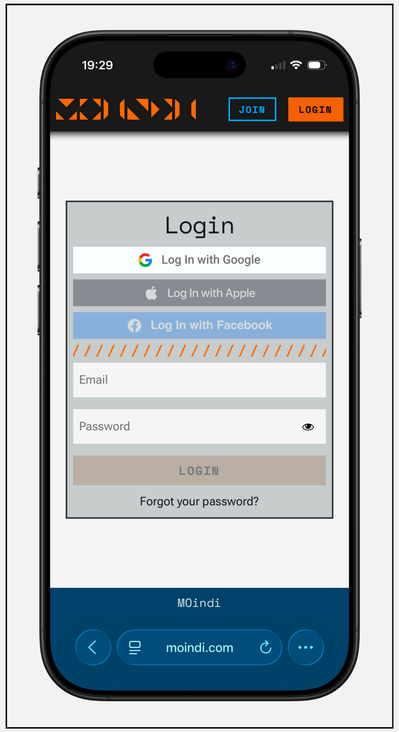
- Navbar uses the correct variant
- Has the correct clearspace
- But it makes the navbar too tall and affects functionality and usable space

Incorrect



- If the navbar gets adjusted but the clearspace is followed verbatim, then the typemark becomes too small

Correct



- The correct variant is used
- An exception is made to the standard clearspace for better functionality and visibility
- Still maintains the intentions behind the clearspace requirements, which is not making it feel cramped

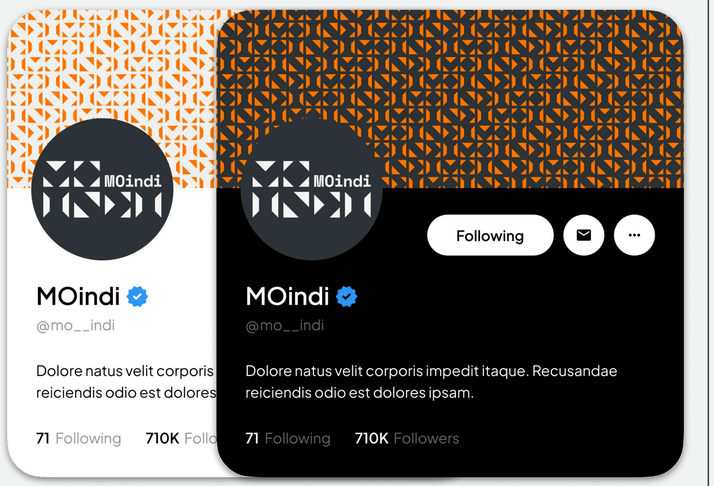
Correct

Correct

Correct

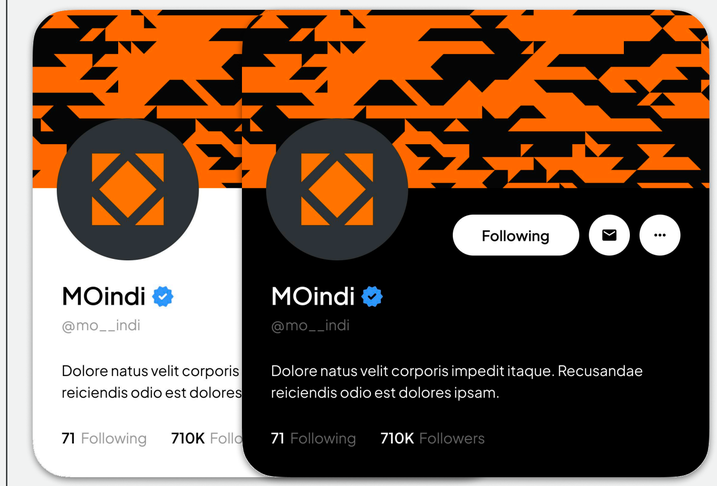
Correct

- Most people seeing this placement won't be familiar with the brand, so the lockup makes the most sense here
- The barrier naturally fits a horizontal typemark, but unfamiliar viewers take priority over matching the format in this context
- Since most people will see this through fast moving broadcast panning shots, the repeated brandmarks are given a lot more space to breathe to account for the motion blur
- Vertical clearspace is reduced for better scaling
- All 4 color schemes are correct
- The best option depends on the surrounding environment and context of the placement



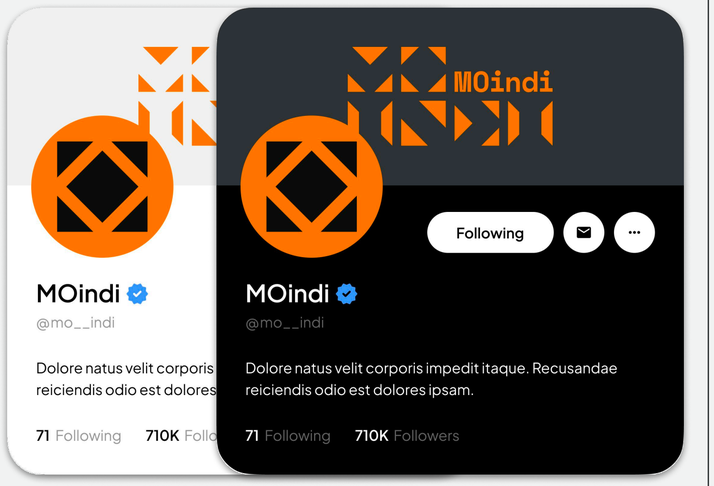
Incorrect

- Profile photos also appear next to comments at much smaller sizes, so the lockup becomes too small to read
- Since the account name is next to the profile photo, repeating the full name isn't necessary
- The MOindi grid is not completely wrong, but because the banner is not treated as a full standalone identity surface, it's not preferred here



Acceptable

- The angle array pattern used deliberately as part of the composition and helps balance the empty space
- Icon usage and clearspace are correct but the dark background makes light mode high contrast but dark mode low contrast
- It's perfectly acceptable, but it can be better when you consider the full context



Incorrect

- The banner is never seen on its own. It always shows up together with the profile image and username
- The banner should help establish the look and feel of the brand
- So using the full lockup just repeats what's already clear and doesn't use the banner in the right way
- The icon feels cramped in the circular frame because it's not following the clearspace rules

Best

- The overlay makes the angle array pattern darker so that the icon can use the preferred color scheme of primary orange background and black icon
- Without the overlay, the orange would blend into the banner
- Using the primary orange background icon, the profile image high contrast in both light and dark modes
